## I. SPIRODIEPOXIDE APPLICATION: PSYMBERIN

## II. DIRECT CARBINOLAMIDE SYNTHESIS

By<br>SEZGIN KIREN

A dissertation submitted to the Graduate School-New Brunswick Rutgers, The State University of New Jersey

In partial fulfillment of the requirements
For the degree of Doctor of Philosophy

Graduate Program in Chemistry
Written under the direction of
Dr. Lawrence J. Williams Ph.D.

And approved by

New Brunswick, New Jersey
October, 2008

## ABSTRACT OF THE DISSERTATION

# III. SPIRODIEPOXIDE APPLICATION: PSYMBERIN <br> II. DIRECT CARBINOLAMIDE SYNTHESIS 

by SEZGIN KIREN
Dissertation Director:
Professor Lawrence J. Williams

The complete structure of Psymberin was determined with the application of the Universal NMR database approach. A formal synthesis of psymberin was completed with the application of spirodiepoxides. An assembly of a dihydroisocumarin ring was accomplished from a complex aldehyde and an anion derived from a pentasubstituted arene. A new condition to couple an aldehyde and an amide was achieved to reach a carbinolamide moiety. This condition was applied for the synthesis of analogs and hybrid structures. In a separate study, a metal and a ligand were investigated to promote the coupling between thioacids and azides.

## ACKNOWLEDGEMENT

I would like to thank to Professor Lawrence J. Williams for his sage advice, guidance and support throughout my career.

I would also like to thank Professor Spencer Knapp, Professor Daniel Seidel and Professor Edmond J. LaVoie for being on my thesis defense committee. I would like to thank Professor Spencer Knapp and Professor Daniel Seidel for their help and stimulating discussions.

I also thank Dr. Tom Emge for obtaining all the crystallographic data.

I would like to thank Dr. Ning Shangguan for his valuable help and Dr. Partha Ghosh for insightful discussions. I would thank all the past and present members of the Williams group for generous support.

Finally, I would like to thank to all my friends and Dr. Ahmet Tarik Baykal for their deepest friendship.

## DEDICATION

This thesis is dedicated to my family.

## Chapter I

## Structure Elucidation of Psymberin

## I. Introduction: Pederin Family

A potent insect toxin was isolated in 1949 from Paederus fuscipes, a Japanese beetle known for its severely irritating bite. This natural product was named pederin and its structure was determined by X-ray crystallography in $1968 .{ }^{1}$ Over the years, a large family of natural products, named after pederin due to structural resemblance, has been discovered. The pederin family is now composed of more than 30 members, including myclamides $\mathrm{A}-\mathrm{B},{ }^{2}$ onnamides $\mathrm{A}-\mathrm{F}^{3}$ and theopederins A-L, ${ }^{4}$ icadamides $\mathrm{A}-\mathrm{B},{ }^{5}$ pseudopederin and pederone ${ }^{6}$, which were all isolated from marine sponges unlike the first member pederin (See Figure 1).

The members of the pederin family contain different tetrahydropyran rings on each side of an amide. The left segment (F2.1) is identical within the family, whereas there are slight structural differences in the right segment ( $\mathbf{F 2 . 3}$ ) from member to member. The other striking similarity is that both segments are bridged by $O$-methyl carbinolamide (F2.2), which is a rare functional group in organic chemistry.

## II. A new Member of the Pederin Family: Psymberin

The Pettit and Crews groups independently isolated a new member of the pederin family in 2004. It was isolated from the marine sponge Ircinia ramose and named irciniastatin A by the Pettit group. ${ }^{7}$ Shortly thereafter, the Crews group reported the isolation of this natural product from the marine sponge Psammocinia, located in the waters of Papua New Guinea, and named it psymberin. ${ }^{6}$ This natural product was considered a new member for the pederin family as it has a highly substituted tetrahydropyran ring "the right segment" like the pederin molecules and the $O$-methyl carbinolamide functional group. The dihydroisocoumarin ring moiety and lack of an exocyclic olefin containing tetrahydropyran ring constitute the structural differences of psymberin from the other pederin members.

## Figure 3 Psymberin

Psymberin (F3)

## III. Biological Activity

Many members of the pederin family possess potent antiviral and antitumor properties apparently due to their ability to arrest protein synthesis. Pederin was shown to efficiently inhibit mitosis of HeLa cells and block protein and DNA synthesis. ${ }^{8}$

Mycalamides displayed inhibition toward marine leukemia P388, human promyelocytic (HL-60), human lung (A549) and colon (HT-29) carcinoma cells at nanomolar levels. Mycalamide A also exhibited remarkable immunosuppressant activity at the picomolar level, making it more potent than the clinical agents FK506 and cyclosporine. ${ }^{9}$

The biological activity of psymberin was interestingly different from the other members in the pederin family. Unlike all the other family members, which showed near equipotent cytotoxicity against different tumor cell lines, psymberin exhibited remarkably selective cytotoxicity. The Crews group reported that the difference in activity can be as much as 10,000 -fold. As shown in the Table $1, \mathrm{LC}_{50}$ values were found to be around 2.5 nM against several melanoma, colon and breast cancer cell lines whereas it was found to be around $2.5 \mu \mathrm{M}$ against all leukemia cell lines investigated. ${ }^{6}$

Due to the biological activity and structural differences between psymberin and members of the pederin family, a structure-activity relationship study is expected to reveal significant information regarding the biological action of these natural products. It is believed that the $O$-alkyl carbinolamide ( $\mathbf{F} 2.2, \mathrm{pg}$. 2) is necessary for cytotoxicity within all of the pederins. The right segment (F2.3, pg. 3) may not be crucial for the selective cytotoxicity since psymberin doesn't possess the typical tetrahydropyran ring. The dihydroisocumarin moiety and vinylic methyl termini could also be reasons for the unprecedented selective cytotoxicity of psymberin.

## IV. Structural Determination of Irciniastatin A and Psymberin

## A. Pettit Group: Irciniastatin A

As shown in Figure 4, the Pettit group was able to assign the structure of irciniastatin A (F4.1) by the use of high resolution mass spectroscopy and 2D-NMR spectroscopy. ${ }^{7}$ Even though they were not able to fully define the assignment of relative and absolute configuration of the molecule, they deciphered the simple connectivity by 2D NMR techniques (principally APT, HMQC, HMBC, and ROESY). HMBC experiments were used to identify the amide linkage and to correlate the amide proton to the $\mathrm{C}_{6}$ carbonyl carbon. Furthermore, interpretation of NOE enhancements provided the assignment of the relative stereochemistry of the carbinolamide and the tetrahydropyran ring. 2D-NOESY and ROESY experiments along with NOE correlations were particularly useful in the deduction of the relative configuration of the four stereogenic centers. They assigned those stereocenters as $7 R, 8 S, 10 R$ and $12 R$. In addition to this, they defined the molecular formula as $\mathrm{C}_{31} \mathrm{H}_{48} \mathrm{NO}_{11}$ from the molecular ion peak at $\mathrm{m} / \mathrm{z}$ $610.3228[\mathrm{M}+\mathrm{H}]^{+}$with the high-resolution FAB mass spectrometry.

Figure 4 Reported Structure of Irciniastatin A by Pettit group

Irciniastatin A (F4.1)

NOE correlations around tetrahydropyran ring (F4.2)

## B. Crews Group: Psymberin

The Crews group employed similar NMR techniques and analyses to determine the structure of psymberin. ${ }^{7}$ Unlike the Pettit group, they were able to assign the relative configuration of most of the stereocenters in the natural product by analyzing NOESY and COSY data as well as ${ }^{1} \mathrm{H}$ NMR coupling constants. Moreover, they used the spectral data obtained from the pederin family members as a reference to assign the absolute stereochemistry based on the following considerations; (a) a probable shared biogenetic origin, (b) analogous NMR data, (c) comparable cytotoxicity, and (d) similar [ $\alpha$ ] values. ${ }^{10}$ They assigned 7 chiral centers as $5 S, 8 S, 9 S, 11 R, 13 R, 15 S, 16 R$ and also determined the C17 chiral center to be $R$ due to a positive Cotton effect generated by the chiral dihydroisocumarin moiety. Nevertheless, the Crews group was unable to define the configuration at the C 4 stereocenter.

## Figure 5 Reported Structure of Psymberin by the Crews group

Both proposed structures shared similarities in the carbon skeleton and relative configuration of the core tetrahydropyran ring. The only difference was the Crews group assigned the chiral center at C 8 in psymberin as S while the Pettit group assigned it as R. ${ }^{11}$ Based on the similarities it was tempting to speculate that psymberin and irciniastatin

A were the same compounds. Matching NMRs of the two molecules was inconclusive since NMR spectrums were taken in different solvents $\left(\mathrm{CDCl}_{3}\right.$ by the Pettit group and $\mathrm{CD}_{3} \mathrm{OD}$ by the Crews group).

## V. Structural Elucidation of Psymberin: Universal NMR Database Approach

Structure elucidation of complex natural products represents a real challenge. Even modern NMR techniques may not generate adequate data for this task. For this reason Kishi and coworkers devised a novel approach to assign the relative and absolute configuration. ${ }^{12}$ The concept and logic of this approach is to: (a) conceptually divide the molecules into small pieces (stereoclusters), (b) compare the NMR profile of a stereocluster to the NMR profile of a synthetic analog of each possible diastereomer, (c) predict the natural product based on the similarity of the NMR profile.

The hypotheses which were developed and later proved experimentally for the approach was (a) the spectroscopic signatures of these stereoclusters are inherent to the specific stereochemical arrangement of the substituents on the carbon chain, (b) the spectroscopic properties of these stereoclusters are independent of the rest of the molecule. On the basis of theses observations, the logic and guidelines were advanced to determine a stereocluster in a molecule. Kishi's group proved the efficiency, reliability and applicability of the approach on the complete structural assignment of several complex natural products. ${ }^{13}$

The complete structure of psymberin could not be determined because there was an ambiguity at one stereocenter of the amide side chain. The configuration of the C5 stereocenter was assigned based on analogy to the members of the pederin family but the
configuration of the C 4 chiral center could not be assigned by multidimensional NMR spectroscopy. Our first task was to assign the relative stereochemistry of the amide side chain, since we were drawn to synthesize psymberin as well as its analogs. Therefore we applied the universal NMR database approach developed by Kishi and coworkers. ${ }^{14}$ We easily identified the stereocluster based on this approach and built an anti (F6.1) and a $\operatorname{syn}(\mathbf{F 6 . 2})$ model which were related to the corresponding stereocluster.

## Figure 6 Anti and Syn Models

## VI. Synthesis of the Anti and Syn Models

The synthesis of the anti (F6.1) and syn (F6.2) models commenced with the coupling of methallyl magnesium chloride ${ }^{15}$ (S1.2) with acetonide-protected glyceraldehyde ${ }^{16}$ (S1.1) derived from D-Mannitol (Scheme 1). This reaction afforded the product in $\mathbf{7 4 \%}$ yield as an inseparable mixture of alcohols $\mathbf{S 1 . 3}$ and $\mathbf{S 1 . 4}$ (dr: 4:3). In order to obtain a single diastereomer of both S1.3 and S1.4 with high yield and diastereoselectivity, we tried the Keck reaction ${ }^{17}$ conditions and treated the same aldehyde with methallyl stannate S1.5 and chiral ligand R-BINOL. Although this reaction resulted in the formation of a single isomer $\mathbf{S} \mathbf{S} \mathbf{3}$ with high selectivity, the yield was low
$(\sim 30 \%)$. As a result, we decided to pursue the Grignard addition reaction because it yielded both of the alcohols in high yield.

## Scheme 1 Anti(S1.3) and Syn(S1.4) Products from Grignard and Keck reaction

We treated the alcohol mixture with MeI under basic conditions and conveniently separated the anti (S2.1) and syn (S2.2) products by silica gel chromatography. We also obtained the anti product from methylation of the Keck reaction intermediate, which served as a reference for the structural assignment of the anti product.

From this point on both the anti and syn compounds were treated under the same conditions to synthesize the models (Scheme 2). Acetonide deprotection under acidic conditions afforded anti and syn diols. ${ }^{18}$ Silylation of both hydroxyl groups followed by selective deprotection of the primary TBS group yielded the anti (S2.3) and syn (S2.7) alcohols. Oxidation of the alcohols, first to aldehyde under Swern oxidation conditions followed by oxidation of the resultant aldehydes, gave anti (S2.4) and syn (S2.7) hydroxyl carboxylic acids. ${ }^{19}$ The cleavage of the secondary TBS group was affected under the Pinnick oxidation condition. The synthesis of the corresponding anti and syn amide models from hydroxyl carboxylic acid was accomplished in one pot by protection of the hydroxyl group with TMS followed by acyl chloride formation and subsequent amidation and finally deprotection of the TMS group. ${ }^{20}$ The anti ( $\mathbf{S} 2.5$ ) and syn (S2.8) models were obtained in $50 \%$ and $54 \%$ yields, respectively.

Scheme 2 Synthesis of Anti (S2.5) and Syn (S2.8) Models

54\% over 4 steps

Surprisingly, the anti model was a white solid while the syn model was an oily compound. The structural proof of the anti model was unambiguously established by single-crystal X-ray crystallography, which revealed three closely related conformers (Figure 7).

Figure 7 Crystal structure: three conformers of the Anti model compound (F6.1).

## VII. Results and Discussions

The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR chemical shifts were determined for the model anti (F6.1) and syn (F6.2) compounds and compared to reported chemical shifts of psymberin. The data is represented in the histogram below where the difference $(\Delta \delta)$ in chemical shifts for some key proton and carbon signals are calculated. As it is seen in Figure 8, the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR chemical shifts of the anti isomer and natural product show little differences, whereas corresponding chemical shifts for the syn isomer differ more with the chemical shifts of the natural product. This trend is especially apparent in the key signals of H3a, H3b, H4, H5, C3, C4, C4-OMe.

The Universal NMR Databases approach, where structural elucidation is achieved by spectral data comparison of complex structures to that of constructed simpler stereoclusters, has been successfully applied to natural products like tetrafibricin, desertomycin, oasomycin. ${ }^{16,17}$ This idea is based on that the chemical shift of a proton or carbon of a stereocluster is dependent on the relative stereochemistry resulting in different NMR signatures for the diastereoisomers. Provided the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ chemical shifts of a short
model polyol differ from the mean chemical shifts of a set of polyols by $\sim 0.10 \mathrm{ppm}$ and $\sim 1.0 \mathrm{ppm}$ respectively, the difference is regarded as a significant. ${ }^{21}$ The difference is assumed insignificant if the differential is smaller than 0.05 ppm and 0.50 ppm for ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ respectively. Thus, there are two criteria that have to be met for NMR database approach to be valid: a) the difference in chemical shifts between the mismatched diastereomer and the unassigned complex structure must be significant and b) the difference between matched diastereomer and the unassigned complex structure must be insignificant.

Figure 8 Differences in ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ chemical shifts between Models and Psymberin ${ }^{22}$

Anti Model (F6.1)

Syn Model (F6.2)

$\begin{array}{lllllll}1-\mathrm{CH}_{2} & \mathrm{H}_{2} & \mathrm{H}_{3 \mathrm{a}} & \mathrm{H}_{3 \mathrm{~b}} & \mathrm{H}_{4} & \mathrm{H}_{5}\end{array}$
${ }^{13}$ C NMR

In the above study we showed that both criteria for NMR database approach are met, which led to the conclusion that the configuration of the amide side chain of psymberin is anti. This approach for structural assignment can not be applied for all stereoclusters. For instance, the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ chemical shift differences of unfunctionalized 1,2-diols are very small such that one can not differentiate between diastereomers. For
such stereoclusters the $\Delta \delta$ of the ${ }^{1} \mathrm{H}$ signals are $<0.04 \mathrm{ppm}$ and $\Delta \delta$ is $<0.4 \mathrm{ppm}$ for ${ }^{13} \mathrm{C}$ signals so the application of this method for the structural assignment of complex natural products might be problematic..$^{5 e, 21}$ However, in such cases like that of amide side chain in psymberin, the 1,2-diol stereocluster is more functionalized and thus the diastereomers exhibit different NMR profiles. ${ }^{23}$ The anti model (F6.1) and the natural product (F5) have a good correlation with a $\Delta \delta$ of $<0.05 \mathrm{ppm}$ for ${ }^{1} \mathrm{H}$ and $<0.5 \mathrm{ppm}$ for ${ }^{13} \mathrm{C}$, whereas the syn model displays $>0.15 \mathrm{ppm}$ and $>1.0 \mathrm{ppm}$ differences for ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$, respectively.

## VIII. Coupling Constant Analysis

For the structural proof of the natural product we also examined the homology of the coupling constants between the models and psymberin (Figure 9). The particular protons that were used for the analysis were vicinal protons $\mathrm{H} 5-\mathrm{H} 4, \mathrm{H} 4-\mathrm{H} 3 \mathrm{a}$ and $\mathrm{H} 4-$ H3b. For the anti model (F6.1) the coupling constant for the $\mathrm{H} 5-\mathrm{H} 4$ was 3.0 Hz whereas it was 1.8 Hz for the syn model (F6.2). The anti isomer also showed similar coupling constant values for the other two vicinal protons $\mathrm{H} 4-\mathrm{H} 3 \mathrm{a}$ and $\mathrm{H} 4-\mathrm{H} 3 \mathrm{~b}$, while it was inconclusive for the syn model because couplings appear as multiplets. Furthermore we calculated the estimated coupling constants from the crystal structure of three conformers for the anti model based on the average dihedral angles. The coupling constants that were obtained from the Karplus equation for the anti model (F6.1) were in good agreement with the natural product, as shown in figure 9. Even though the coupling constants for the natural product were taken in solution, they approximately matched what would be expected for the three conformers in the crystal. ${ }^{24}$ The results support the anti assignment of the side chain of the natural product.

Figure 9 Coupling Constants Analysis for Psymberin ${ }^{25}$

| Average <br> Dihedral Angel <br> for three conformers | Estimated <br> Average $^{\text {a }}$ | Anti <br> Model (F6.1) | Psymberin |  |
| :--- | :---: | :---: | :---: | :---: |

| $\Phi\left(\mathrm{H}_{4}, \mathrm{H}_{3 \mathrm{a}}\right)$ | -66.1 | $1-3$ | 3.0 | 3.5 |
| $\theta\left(\mathrm{H}_{4}, \mathrm{H}_{3 \mathrm{~b}}\right)$ | 176.7 | $9-10$ | 9.3 | 9.5 |
| conformers in crystal structure |  |  |  |  |

## IX. Stereochemical Assignment of Amide Side Chain by Degradation Studies

Floreancig and coworkers used a different approach to assign the stereochemistry of the amide side chain. ${ }^{26}$ They compared the products that were obtained from acidmediated degradation of both models and psymberin. The models used for the studies were anti (S3.3), ent-anti (S3.7), syn (S3.4), ent-syn (S3.8) (Scheme 3). These molecules were readily accessed from methyl glycerate ( $\mathbf{S 3 . 1}$ and $\mathbf{S 3 . 5}$ ), which can be prepared in enantiomerically form from D-serine and L-serine. The esters (S3.1 and S3.5) were reduced to the corresponding aldehydes (S3.2 and S3.6) in 3 steps. Methallylation of the aldehydes (S3.2 and S3.6) afforded the separable anti and syn products which were then carried on the corresponding carboxylic acids (anti; S3.3 and S3.7, syn; S3.4 and S3.8) in 3 steps. The last step transformation of the carboxylic acids into the $O$-methyl protected carbinolamides (anti; S3.9 and 3.11, syn; $\mathbf{3 . 1 3}$ and 3.15) by the application of the Matsumoto protocol. ${ }^{27}$ Exposure of these models to $\mathrm{H}_{2} \mathrm{SO}_{4}$ in MeOH at $60{ }^{\circ} \mathrm{C}$ for 12 h afforded the corresponding cyclized products (anti S3.10 and S3.12, syn S3.14 and S3.16). These tetrahydrofurans were separable by GC and characterized by NOESY experiment to establish the spatial relation between the methoxy and carbomethoxy groups. Interestingly no epimerization was observed at the alpha position of the ester under the reaction conditions.

Similarly, they treated psymberin with $\mathrm{H}_{2} \mathrm{SO}_{4}$ in MeOH at $60{ }^{\circ} \mathrm{C}$ for 12 h and obtained the cyclized tetrahydrofuran, which matched with the product produced from model S3.11, as determined by GC-MS. They concluded that the relative and absolute stereochemistry of the amide side chain should be anti $4 S, 5 S$ as in model $\mathbf{S 3 . 1 1}$, which is consistent with the NMR database approach applied by our group. ${ }^{18}$

## Chapter II

## Synthetic Strategies for Pederin Family members

## I. Introduction

Due to its high structural complexity and selective cytotoxicity we were drawn to develop a synthesis of the new member of the pederin family, psymberin. We sought to develop synthetic strategies to reach this molecule as well as analogous and hybrid structures, which may help in understanding the exceptional biological activity of the natural product. In order to achieve this difficult task we sought to take advantage of the tactics which were developed for the synthesis of the other members of the pederin family. In this chapter we deal with some examples of strategies developed by different groups in the past three decades. In light of these strategies we will focus on our two novel approaches to psymberin in the next two chapters.

As shown in Figure 10 many groups have spent a great deal of synthetic effort to finish total syntheses of the members of the pederin family, ${ }^{1-5}$ as well as the partial and formal syntheses of these compounds. ${ }^{6}$ Obviously, the challenges posed by these molecules stimulated many groups to execute creative synthetic tactics. Among these there is one common strategy that every group, without exception, applied: convergent construction of the molecules. This reasonable tactic has been very effective and applicable to all the members of the family.

Figure 10 Total Syntheses of Pederin Family Members by Different Groups

| Pederin | LLS |
| :--- | :--- |
|  | LLS |
| Matsumoto (1988) | 30 steps |
| Nakata (2002) | 24 steps |
| Kocienski (2000) | 25 steps |
| Rawal (2007) | 12 steps |

## LLS=Longest Linear Sequence

Theopederin D
Kocienski (2000) $\quad \frac{\text { LLS }}{34 \text { steps }}$

Onnamide A
Kishi (1991) $\frac{\text { LLS }}{25 \text { steps }}$

We mentioned the similar structural units within the family members in Figure 2 (pg 2). In the case of the application of convergent synthesis, the left (F2.1) and right (F2.3) segments of the members constitute two simpler units to reach the target molecules (Figure 11). One unit is the pederic acid (F11.1). However, the other unit is either the core tetrahydropyran ring (F11.2) as seen in pederin or the trioxadecalin ring (F11.3) as seen in mycalamides, theopederins and onnamides. Even though highly efficient syntheses of these units have been published, the real challenge comes from
joining the units. Formation of the $O$-methyl carbinolamide (F2.2) from two units is a difficult task, since it is a very sensitive functional group. Nevertheless, there are several methods that can be applied to join these two units through the formation of $O$-methyl carbinolamide, which will be discussed in detail in chapter 4.

Figure 11 Disconnections for the Synthesis of Pederin and Mycalamide A

Similarly, the convergent synthesis of the psymberin can be done by joining two halves at the carbinolamide bond (Figure 12). The left segment, called psymberic acid (F12.1), is analogous to pederic acid (F11.1) in other members. The right segment, containing the core tetrahydropyran ring (F11.2) as in pederin, is additionally flanked by a dihydroisocumarin ring. The trioxodecalin ring (F11.3) looks similar since it bears a closely related core tetrahydropyran ring with an affixed six- membered ring.

## Figure 12 Disconnection for Psymberin

In 2005, the De Brabander group reported the first total synthesis of psymberin via the disconnection shown in Figure $12 .^{7}$ Later, the Floreancig group published a partial synthesis with the same strategy (F12.2). ${ }^{8}$ Lastly, the Huang group came up with an interesting strategy by employing a linear synthetic strategy to finish the total synthesis. ${ }^{9}$

Our synthetic strategy also depended on the disconnection shown in Figure 12. ${ }^{10}$ We accomplished the synthesis of the psymberic acid segment (F12.1), which was mentioned in Chapter 1 (Scheme 2). The construction of the right segment (F12.2) with a novel strategy and the formation of the O-methyl carbinolamide ( $\mathbf{F 2 . 2}$ ) will be the focus of chapter 3 and 4, respectively. In this chapter, we will cover some elegant synthetic strategies for the synthesis of the tetrahydropyran ring and trioxadecalin ring systems from the literature. In addition to this, the syntheses of psymberic acid and the right segment of psymberin by the De Brabander and Floreancig groups are summarized. However, Huang's total synthesis of psymberin as well as completion of the total synthesis of pederin and the myclamides are addressed in Chapter 4.

## II. Synthesis of the Tetrahydropyran Ring

## A. The Matsumoto Strategy

The early synthetic efforts to construct the tetrahydropyran ring were reported by Matsumoto in 1982. ${ }^{\text {1a-e }}$ The key step in their synthesis was the substrate directed asymmetric reduction of the ketone of S14.2 and, later, the ketone of S14.4. The core ring formation was obtained from the epoxide under acidic conditions (S14.6 $\rightarrow$ S14.7). Regardless, the selectivity for the formation of the epoxide was low. The stereochemistry of the ester group in S14.8 was set by enolization and then kinetic protonation of S14.9, which provided the desired product $\mathbf{S 1 4 . 1 0}$ in low yield and selectivity. This route was too lengthy, consisting of 23 steps.

## Scheme 14 The Matsumoto Strategy

## B. The Hoffmann Strategy;

A concise and highly efficient synthesis was accomplished by the Hoffman group. ${ }^{\text {ade }}$ The first key step was asymmetric allylation of aldehyde $\mathbf{S} 15.2$ with chiral borane reagent (S15.9), which gave good yield and moderate selectivity. The second key step was again asymmetric allylation of aldehyde S15.4, but this time with the different chiral borane reagent S15.10. Likewise, a fairly good yield and moderate selectivity was obtained from this reaction. Ozonolysis of the double bond in S15.6 afforded the cyclic core structure in its hemiacetal form, which was subsequently protected with a benzoyl group (S15.7). They completed the synthesis of the ring by introducing a cyano group to S15.7 followed by oxidation to the amide S15.8.

## Scheme 15 The Hoffmann Strategy

## C. The Nakata Strategy

Another elegant synthesis of the tetrahydropyran was accomplished by the Nakata group. ${ }^{\text {lh }}$ They applied a $\mathrm{SmI}_{2}$-mediated intramolecular Reformatsky reaction to utilize the
core ring (S16.1 $\rightarrow \mathbf{S 1 6 . 2}$ ). This reaction took place smoothly, which afforded one single product in $85 \%$ yield. After introduction of an allyl group to $\mathbf{S 1 6 . 3}$ with complete axial selectivity, the Sharpless asymmetric dihydroxylation of the double bond in S16.3 furnished diol S16.4 in good yield, albeit with low selectivity (3:1). The synthesis of S16.5 was completed in 16 steps with a $35 \%$ overall yield.

## Scheme 16 The Nakata Strategy

## D. The Rawal Strategy

Recently, the Rawal group came up with an outstanding strategy for the synthesis of the core ring of pederin (Scheme 17). ${ }^{1 \mathrm{~m}}$ Assembly of the ring was convergently furnished by a three-step reaction sequence from aldehyde S17.2. Firstly, they applied a hetero-Diels-Alder reaction (or Mukaiyama Aldol cyclization) between aldehyde S17.2 and diene S17.3, which took place with excellent diastereoselectivity. Secondly, they took advantage of a Mukaiyama-Micheal reaction to combine pyranone S17.4 and silyl ketene S17.5, which also proceeded with excellent diastereoselectivity. Finally, the reduction of pyranone S17.6 with L-Selectride predominantly afforded the desired product (S17.7) in 7 steps overall.

## Scheme 17 The Rawal Strategy

## III. Synthesis of the Trioxadecalin Ring

## The Rawal Strategy

The Rawal group has also recently published the total synthesis of mycalamide A. ${ }^{1 \text { h }}$ They applied effective and stereoselective methods for the preparation of the trioxadecalin ring (F11.2) and pederic acid (F11.1). Their synthesis started with methyl tartarate (S18.1), which was transformed into the aldehyde (S18.2) in 4 steps (Scheme 18). A chelation-controlled methallylation furnished alcohol $\mathbf{S 1 8 . 3}$ as a single diastereomer. After protecting group manipulations, S18.5 was treated with ozone and then acetic anhydride. The resulting lactol acetate was treated with allyltrimethylsilane and $\mathrm{BF}_{3} . \mathrm{OEt}_{2}$ to provide $\mathbf{S 1 8 . 6}$ as a single diastereomer. Transformation of S18.6 to $\mathbf{S 1 8 . 7}$ was accomplished in three steps, which afforded the product in a ratio of 5.4:1. Asymmetric dihydroxylation resulted in the formation of the desired diol (S18.8), which was then protected as the corresponding acetate. The anomeric acetate was transformed to an azide with $\mathrm{TMSN}_{3}$, which was reduced to a mixture of aminal diastereomers (S18.9). They completed the synthesis in 21 steps and $10.5 \%$ overall yield.

Scheme 18 The Rawal strategy

## IV. Synthesis of the Psymberic Acid

## The De Brabander Strategy

The De Brabander group started the synthesis of the target with the protected glyceraldehyde S19.1 and treated it with a chiral borane reagent ((-)- $\left.\mathrm{Ipc}_{2} \mathrm{BOMe}\right)$ to afford an anti product which was methylated and deprotected to give the diol (S19.2). ${ }^{7}$ The antipodal borane reagent $\left((+)-\mathrm{Ipc}_{2} \mathrm{BOMe}\right)$ was used to obtain the corresponding syn compound. Both anti and syn products were elaborated to their respective final carboxylic acids after a series of protecting group manipulation and oxidation reactions shown in Scheme 19.

Scheme 19 The De Brabander Strategy

## V. Synthesis of the Right Segment of Psymberin

## A. The De Brabander Strategy

The synthesis of this segment stemmed from the coupling of two simpler units. The aryl fragment $\mathbf{S 2 0 . 3}$ (Scheme 20) was finished in 7 steps from aryl aldehyde $\mathbf{S 2 0 . 1}$ by employing such reaction conditions as: a) oxidation/amidation, (b) orthomethalation/allylation, (c) methyl ether deprotection with $\mathrm{BBr}_{3}$, (d) methyl ester formation, (e) protection with PMB group, (f) oxidative double bond cleavage.

The core pyran ring formation commenced with the application of asymmetric allylation of aldehydes S20.4 and S20.5 with Leighton's silane reagent (S20.9) to furnish a $C_{2}$-symmetrical diol, which was monosilylated to give $\mathbf{S 2 0 . 6}$. Ozonolysis followed by acetylation gave S20.7. The synthesis was completed by addition of an ethyl group to S20.7, displacement of acetate with TMSCN and then oxidation of a secondary alcohol to ketone S20.8.

## Scheme 20 The De Brabander Strategy

The coupling of the two units ( $\mathbf{S 2 0 . 2}$ and $\mathbf{S 2 0 . 8}$ ) was accomplished via an aldol reaction to afford the major syn product $\mathbf{S 2 1 . 1}$. 1,3 syn reduction of $\mathbf{S 2 1 . 1}$ with catecholborane and then basic work-up gave a lactone, which was desilylated with TBAF to yield $\mathbf{S 2 1 . 2}$. The final steps to get the right segment $\mathbf{S 2 1 . 3}$ were a hydrolysis of the nitrile group with the Parkins catalyst (S21.4), deprotection of the PMB group by hydrogenation and, lastly, acetylation of the hydroxyl groups with acetic anhydride.

Scheme 21 The De Brabander Strategy

## B. The Floreancig Strategy

This group accomplished the synthesis of the right segment from the coupling of S22.6 and S23.6. ${ }^{8}$ They used the Diels-Alder cycloaddition reaction between diene S22.1 and allene $\mathbf{S 2 2 . 2}$ as a key step in the preparation of the arene partner S22.6, which efficiently yielded $70 \%$ of the product. Protection of $\mathbf{S 2 2 . 3}$ with TBS followed by reduction with DIBAL furnished aldehyde $\mathbf{S 2 2}$.4, which was exposed to the Brown crotylation conditions to produce S22.5 as a single diastereomer. Protection with TBS followed by ozonolysis completed the synthesis of S22.6.

## Scheme 22 The Floerancig Strategy

The preparation of the second coupling partner $\mathbf{S 2 3 . 4}$ started from the reaction of aldehyde S23.1 with Leighton's silane reagent S23.2, which gave the alcohol (S23.3) in high yield and selectivity. Protection with TES followed by TMS enol ether formation furnished S23.4 quantitatively. S22.6 and S23.4 were coupled through a Mukaiyama aldol reaction in the presence of $\mathrm{BF}_{3} . \mathrm{OEt}_{2}$, which gave the desired product ( $\mathbf{S 2 3 . 5}$ ) selectively in high yield. Substrate directed asymmetric reduction of S23.5 afforded a single product (S23.6) in $74 \%$ yield. Ozonolysis followed by acetylation resulted in formation of tetrahydropyran $\mathbf{S 2 3 . 7}$. Exposure of $\mathbf{S 2 3 . 7}$ to TMSCN replaced the anomeric acetyl group with a nitrile, which was then oxidized to amide S23.8 with the Parkins catalyst (S21.4). They finished the synthesis of this segment in 12 steps from known materials in $15 \%$ overall yield. It should be noted, however, that this is a partial synthesis.

## Chapter III

## Spirodiepoxide Application: Psymberin

## I. Background Information for Spirodiepoxides

Spirodiepoxides (SDE) result from the double oxidation of an allene (Scheme 24, $\mathbf{S 2 4 . 1} \rightarrow \mathbf{S 2 4 . 2}$ ). These molecules have an unusual structure bearing two affixed epoxides and represent a rare functional group. They are electrophilic compounds which would be expected to readily react with nucleophiles. Opening of SDEs with nucleophiles leads to a motif that has a ketone, alcohol and substitutent corresponding to the nucleophile (S24.3). It also generates two stereocenters at the alpha positions of the ketone. The major product is syn. As with other cascade reactions, allene oxidation to SDEs offers a new way to access densely functionalized structures.

## Scheme 24 SDE Formation and Opening

The oxidation of allenes can be accomplished by either a peracid oxidant or a neutral non-nucleophilic oxidant such as dimethyl dioxirane (DMDO). Decomposition of SDEs to various products can occur due to the acid by-product of oxidation by a peracid. However, DMDO affects a clean oxidation leading to isolable SDEs. The Crandall group performed initial studies of the formation and reactivity of SDEs after the discovery of

DMDO. ${ }^{1}$ The SDEs studied were derived from unfunctionalized, achiral, symmetric allenes (Scheme 25, S25.1 $\rightarrow \mathbf{S 2 5 . 3}$ ). The addition of different types of nucleophiles to these SDEs, both intermolecularly and intramolecularly, was studied, which afforded modest product formation. The heteroatom nucleophiles for intermolecular opening of SDEs were water, alcohols, acetic acid, amines imidazole, thiophenol, fluoride and chloride. ${ }^{1 \mathrm{i}}$ The addition of these nucleophiles was observed to attack at the less sterically hindered carbon atom of the SDE functionality in $\mathrm{S}_{\mathrm{N}} 2$ fashion. Also, the addition of water to the cyclic SDE S25.4 showed that both hydroxyl groups were oriented in the same direction (S25.6), which was the only example demonstrating that the syn product is the major product obtained from addition of a nucleophile to a SDE. ${ }^{1 \mathrm{i}}$

## Scheme 25 SDEs by the Crandall Group

In the case of intramolecular nucleophilic addition to a SDE they reported formation of functionalized oxygen heterocycles from allenes tethered with three types of functional groups; (a) alcohols, (b) carboxylic acids, (c) aldehydes. The opening of $\alpha, \delta$ allenyl alcohols formed the furan products $(\mathbf{S 2 6 . 1} \rightarrow \mathbf{S 2 6 . 2}$ and $\mathbf{S 2 6 . 5} \rightarrow \mathbf{S 2 6 . 6})$, while $\beta, \gamma-$ allenyl alcohols gave the pyran products $(\mathbf{S} 26.3 \rightarrow \mathbf{S} 26.4$ and $\mathbf{S 2 6 . 7} \rightarrow \mathbf{S} 26.8) .{ }^{1 \mathrm{~g}, 1 \mathrm{j}}$ Relatively simple allenes, where $R^{1}, R^{2}, R^{3}, R^{4}$ were either $H$ or $\mathrm{CH}_{3}$ groups, were used for the investigation. The primary and tertiary alcohols were observed to efficiently open SDE intramolecularly, while no secondary alcohol openings were reported. The
regiochemistry of ring closure was dictated by the number of carbons in the tethered chain in order to give favorable five or six-membered heterocycles by either exo or endocyclization. ${ }^{2}$

## Scheme 26 Cyclization of Allenic Alcohols

They also showed cyclization of several simple allenyl carboxylic acids to provide five or six membered functionalized lactones. ${ }^{\text {hh, } 1 \mathrm{j}}$ Moreover, oxidation of allenyl aldehydes and ketones led to the formation of corresponding cyclized products, which were either hemiacetals or ketals depending on the solvent used. ${ }^{1 \mathrm{k}}$ Interestingly, no oxidation of aldehydes was observed since it is slower than that of an allene.

The Williams group has focused on developing new reactions and applying them to the synthesis of biologically and chemically important molecules. ${ }^{3}$ The first use of SDE in total synthesis was elegantly demonstrated in the synthetic studies for the natural product, epoximicin. ${ }^{3 f}$ In the course of these studies, it was also shown that SDEs can be opened by different nucleophiles such as azides, the anion from of benzenesulfonamide, lithium benzimidate and others. Additionally, the opening of SDEs with organocuprates
was developed and the efficiency of this methodology was demonstrated in the synthesis of a stereotetrad found in $9 S$-dihydroerythronolide A. ${ }^{3 \mathrm{e}}$

Our group also obtained the first crystal structure of the SDE derived from oxidation of tetramethyl allene (Scheme 27). ${ }^{3 c}$ Surprisingly, treatment of the allene (S27.1) with DMDO afforded the solid SDE (S27.2) which has a low melting point and thus purified by sublimation. The crystal structure data revealed significant information regarding key bond lengths, which were highlighted by the comparison to the data of a simple acetal (S27.3) and epoxide (S27.4). Significant structural features of SDE include; (a) shorter $\mathrm{C} 2-\mathrm{O} 1 / \mathrm{O} 2$ bond lengths than simple acetals, (b) shorter $\mathrm{C} 2-\mathrm{C} 1 / \mathrm{C} 3$ and $\mathrm{C} 2-$ $\mathrm{O} 1 / \mathrm{O} 2$ bonds than epoxides, (c) longer $\mathrm{C} 1-\mathrm{O} 1$ and $\mathrm{C} 3-\mathrm{O} 2$ bonds than epoxides. These data were also compared and matched to the data obtained computationally.

Scheme 27 Crystal Structure of SDE

The mechanism of SDE opening is probably a one step process, even though there are some reported mechanistic models which involve charged intermediates (S28.1 versus S28.2, S28.3, and S28.4). It is known that anionic nucleophiles open SDEs readily.

However, SDEs must be activated for neutral nucleophiles. These hydrogen-bonding activators are mostly hydroxylic reagents like water or methanol. A new type of nucleophiles which both activate and open SDEs was discovered by our group. We demonstrated an elegant way to form heterocycles from neutral nucleophiles such as benzamide, thiobenzamide and benzamidine. ${ }^{3 \mathrm{c}}$ The transition model (S28.8) proposed for these transformation features similarly concerted opening of the activated SDE. This was also supported by computed transition models. It revealed that the C1-O1 bond lengthens, the $\mathrm{O} 1-\mathrm{C} 2$ bond shortens, and the $\mathrm{C} 2-\mathrm{O} 2$ bond lengthens when nucleophiles attack the SDE (Scheme 28).

Scheme 28 Transition Models for SDE Opening

## II. Spirodiepoxides in Psymberin Synthesis: $1^{\text {st }}$ generation

As mentioned earlier, we wanted to synthesize psymberin and its analogs as well as hybrid structures. Therefore, we needed a novel and feasible strategy to reach this goal. As expected, the natural product $\mathbf{S 2 9 . 1}$ was bisected into two segments; psymberic amide S29.2 and the right segment S29.3. Preparation of S29.3 of psymberin was a challenge as it contains a highly substituted core tetrahydropyran ring and an appended dihydroisocumarin ring. We envisioned the core tetrahydropyran ring S29.4 could be accessed from SDE S29.5, which would be derived from oxidation of allene S29.6. This key step would give us both a highly oxygenated $(X=O)$ and subsequently a simpler ring $(\mathrm{X}=\mathrm{H})$, which would enable us to prepare a range of psymberin analogs and hybrid structures. Addition of a propionate unit $\mathbf{S 2 9 . 7}$ followed by dihydroisocumarin ring formation using S29.8 would complete the synthesis of the right segment. Direct coupling of these two units will be discussed in chapter 4.

## Scheme 29 Synthetic Plan: $1^{\text {st }}$ generation

Unlike alkenes, oxidation of allenes includes a problem of regioselectivity. In general, the more substituted double bond will be more easily oxidized because it is more electron rich. In the case of mono- and tri-substituted allene the more substituted double bond will be oxidized first, but in case of di- and tetrasubstituted allenes regioselectivity may be governed by steric and electronic effects. The oxidation of trisubstituted and disubstituted allenes was demonstrated in Scheme 30. Another problem is stereoselectivity. The oxidation should take place on the face of the double bond which is most accessible.

## Scheme 30 Stereoselectivity in Allene Oxidation

The first oxidation is comparatively slow and leads to the formation of major-anti (S30.2) and minor-syn (S30.3) allene oxides. The allene oxides which are very reactive because of their electron rich nature should oxidize rapidly and result in formation of SDEs. ${ }^{4}$ The other problem is opening of a SDE regioselectively. The nucleophilic attack takes place on the carbon with less substituents for $\mathrm{S}_{\mathrm{N}} 2$-like reactions and could give up to four different products ( $\mathbf{S 3 0 . 8}, \mathbf{S 3 0 . 9}, \mathbf{S 3 0 . 1 0}, \mathbf{S 3 0 . 1 1}$ ). S30.8 and $\mathbf{S 3 0 . 1 1}$ as well as $\mathbf{S 3 0 . 9}$ and $\mathbf{S 3 0 . 1 0}$ are enantiomers. The major product should be $\mathbf{S 3 0 . 8}$ resulting from the anti-anti SDE (S30.4), whereas the minor will be S30.9, formed from S30.5. The formation of the antipodal products ( $\mathbf{S 3 0 . 1 0}$ and $\mathbf{S 3 0 . 1 1}$ ) may not be observable if the
formation of the syn allene oxide ( $\mathbf{S 3 0 . 3}$ ) is low. The ratio of the second oxidation will reflect the ratio of the major and minor products. For example, if the selectivity of the first oxidation is high (>20:1) and the second oxidation is low (2:1), the ratio of products will appear to be $2: 1$. Therefore, an enantiomerically pure product could be obtained from optically pure allene.

The initial work done by Crandall's group showed the formation of cyclic ethers from the oxidation of simples, unfunctionalized and achiral allenes (Scheme 26). ${ }^{1 \mathrm{~g}, 1 \mathrm{j}}$ The major problem was that the selectivity of oxidation was not synthetically useful, for example, see Scheme 31. However, our group aimed to increase the streoselectivity of allene oxidation and to demonstrate the application in complex molecule synthesis. Dr. Shangguan, a former graduate student in our group, did some preliminary studies on the oxidation of allenes structurally similar to S29.6. Allene S32.1 was prepared and treated with DMDO in acetone (Scheme 32). The corresponding SDE was cyclized immediately and afforded the isolable trans (30.2) and cis (S30.3) products in modest yield (60\%) and in a ratio of 2.5 to 1 , respectively. ${ }^{3 d}$

## Scheme 31 Simple Allene Cyclizations

## Scheme 32 Preliminary Results for Model Allenes

The Murray group developed a procedure to prepare DMDO in acetone. ${ }^{5}$ Acetone is easily oxidized to DMDO upon treatment with potassium monopersulfate $\left(\right.$ Oxone $\left.^{\circledR}\right)$ at room temperature. The low-boiling solution of DMDO in acetone is then distilled and condensed with a cold trap. The resulting solution is a low concentration of DMDO (0.05-0.1M). However, Messeguer's group reported a modified procedure to increase the concentration of DMDO in different solvents such as chloroform, dicholormethane, ethyl acetate and toluene. The concentration of DMDO can approach 0.3 M after extraction with chloroform. This group also checked the reactivity of a DMDO solution in chloroform by epoxidation of cis-stilbene and found out that epoxidation takes place much faster than with DMDO in acetone solution.

When allene S32.1 was treated with DMDO in chloroform, the trans $\mathbf{S 3 2 . 2}$ and cis S32.3 products were formed in a 6:1 ratio (Scheme 32). The improved stereoselectivity of the DMDO oxidation in chloroform could be a consequence hydrogen bonding formation between DMDO and chloroform, which would make it bulkier and more active than DMDO in acetone. This could result in an increase in the selectivity of the second oxidation of an allene. Our group demonstrated the improvement of stereoselectivity in SDE formation on simple and complex allenes by using DMDO in chloroform. In
addition to this, different solvent systems have also been studied to increase stereoselectivity on the oxidation of allenes. ${ }^{6}$

We aimed to synthesize the target allene (S29.6) asymmetrically. For this purpose, we pursued the Myers method to reach $\mathbf{S 2 9 . 6}$ as it provides enantiomerically pure 1,3 disubstituted allenes in a single pot from propargyl alcohols. ${ }^{7}$ In this procedure, optically pure propargyl alcohols (S33.1) are treated with $O$-nitrobenzenesulfonyl hydrazide under Mitsunobu conditions to afford the optically pure adduct $\mathbf{S 3 3 . 2}$ with inversion at the stereocenter. Elimination followed by ene rearrangement in situ give rise to the formation of enantiopure allenes (Scheme 33).

## Scheme 33 Myers Allene Synthesis

The strategy for the key allene $\mathbf{S 2 9 . 6}$ leading to the core pyran ring is shown in Scheme 34. We reasoned that a simple allene (S34.1) could be accessed from propargyl alcohols S34.2 and S34.6 under the Myers conditions. Using alcohol S34.2 would be a better choice since the first step, a Mitsunobu inversion reaction, would suffer from the presence of a neopentyl center in alcohol S34.6. The preparation of alkynone S34.3 would be accomplished from the coupling of Weinreb amide (S34.4) and alkyne (S34.5).

Scheme 34 Synthetic Strategy for Allene S29.6

The synthesis is presented in Scheme 35. The alkyne (S35.1) was prepared using two different conditions from the same starting material. Under the Corey-Fuchs condition, aldehyde S35.2 was reacted first with triphenylphospine and tetrabromomethane to yield a dibromoalkene compound, which on treatment with $n-\mathrm{BuLi}$ afforded the alkyne in $70 \%$ yield after two steps. ${ }^{8}$ This reaction, when used in large scale, produced amounts of insoluble triphenylphosphine oxide solid as a by-product that were not easy to separate from the desired product. The Seyferth-Gilbert condition converted S35.2 to S35.1 in a higher yield $87 \%$ and provided an easier work-up to remove all the solids with a water wash. ${ }^{9}$ For the Weinreb amide synthesis (S35.5), the methyl glycolate (S35.3) was first protected with TBDPS and was then added to a solution of $i-\mathrm{PrMgCl}$ and $\mathrm{Me}(\mathrm{OMe}) \mathrm{NH} . \mathrm{HCl}$ to give $\mathbf{S 3 5 . 5} .{ }^{10}$ To couple these two units, $\mathbf{S 3 5 . 1}$ was first deprotonated with $n$-BuLi reagent and then treated with $\mathbf{S 3 5 . 4}$ to give alkynone $\mathbf{S 3 5 . 6}$ in $72 \%$ yield.

## Scheme 35 Preparation of Alkyne and Weinreb amide

The asymmetric reduction of alkynone (S35.6) was achieved by using the Noyori condition (Scheme 36). ${ }^{11}$ To a solution of Ru catalyst with chiral ligand (S36.4) in isopropanol was added a solution of (S35.6) in isopropanol at room temperature, which produced the product readily in $98 \%$ yield. The optical purity of the propargyl alcohol (S36.1) was measured by Mosher esters analysis and found to be $98 \%$ ee. It is known that a terminal alkyne can poison the Noyori catalyst. Therefore, using pure starting material is crucial for the reaction. The next step was the application of Myers' method to furnish the optically pure allene ( $\mathbf{S 3 6 . 2}$ ) from $\mathbf{S 3 6 . 1}$, which gave the desired product in $70 \%$ yield. The side product of this reaction was found to be a product resulting from migration of the TBDPS group from primary alcohol to secondary alcohol. Also, the yield of the reaction was sensitive to the purity of the $O$-nitrobenzensulfonyl hydrizide, as reported by Myers. ${ }^{6}$

## Scheme 36 Noyori Reduction

Treatment of $\mathbf{S 3 6 . 2}$ with DDQ resulted in cleavage of the PMB group. The by-product anisaldehyde interestingly had the same Rf value with the original product and was hard to remove by FCC. However, reduction of it with $\mathrm{NaBH}_{4}$ provided a clean separation of the allenyl alcohol (S36.3).

Oxidation of S36.2 with Dess-Martin afforded the aldehyde (S37.1, Scheme 37), which was then treated with ethynylmagnesium bromide at low temperature to give rise to a mixture of S37.3 and S37.4 (dr; 1:1, determined by ${ }^{1} \mathrm{H}$ NMR). The diastereomeric mixture of alcohol products was exposed to the Dess-Martin reagent to afford the ketone S37.2 in 80\% yield over 3 steps. The asymmetric reduction of $\mathbf{S 3 7 . 2}$ was accomplished by use of Corey-Bakshi-Shibata ( $S$-isomer) reagent to give inseparable alcohols (S37.3 and S37.4) in $90 \%$ yield. ${ }^{12}$ The ratio of the reaction was $10: 1$, determined by ${ }^{1} \mathrm{H}$ NMR.

## Scheme 37 Formation of the Key Allene

Dr. Shangguan prepared allenes S38.1 and S38.2 (Scheme 38). The general procedure applied for allene oxidation was: a solution of an allene in chloroform at low temperature was treated with a freshly prepared solution of DMDO. After $30 \mathrm{~min}, \mathrm{MeOH}$ was added to the reaction mixture and stirred for 12 h . Gratifyingly, cyclization of SDEs from all three allenes afforded 2,6 substituted trans and cis pyranones. In all cases, the 2,6 trans product was the major one. It was observed that the selectivity of the SDE formation changed with the size of the protecting groups. The bulkier they are the more selective product formation is. The smallest MOM protecting group gave a $4: 1$ ratio, TBS gave a $6: 1$ ratio. The bulkiest TBDPS group yielded $72 \%$ of the 2,6 trans disubstituted pyranone S36.3. With this reaction, the chemo-, regio- and stereo- selective oxidation of 1,3 disubtituted allenes was accomplished as planned. Consequently, the TBDPS group was found to be optimal for the synthesis of the target. Also, the terminal alkyne stayed intact since it is known that its oxidation with DMDO is slower than that of an allene. ${ }^{13}$

## Scheme 38 Cyclization of Allenes

The DMDO oxidation of allenes in Scheme 38 gave only two isomers out of a possible four (check Scheme 30) and that the selectivity of oxidation changes with the size of protecting group were interesting observations. These results can be reasoned from stepwise oxidation of allene explained as followed. The first oxidation takes place regioselectively on the double bond distal to the oxygen substitutent which deactivates the proximal double bond. Moreover, this oxidation occurs slowly and highly stereoselectively, giving the anti allene oxide (S39.1) as the major intermediate and the syn allene oxide as minor intermediate (S39.2). Also, the size of the protecting groups appears to play a role in the selective formation of S39.1 and S39.2. The second oxidation of $\mathbf{S 3 9 . 1}$ should take place very fast and less stereoselectively, giving S39.3 as the major SDE, since the sterically demanding tert-butyl group induces the delivery of oxygen from the opposite face. The minor SDE would be S39.2. S39.3 and S39.4 lead to the formation of the observed trans and cis products, respectively. The second of oxidation of the minor syn intermediate ( $\mathbf{S 3 9 . 2}$ could furnish the antipodal trans and cis products, but they could not be observed.

Scheme 39 SDE Formation from Allene

During the oxidation of allene $\mathbf{S 3 7 . 3}$, we needed to use MeOH whereas it was not necessary for the epimeric allene $\mathbf{S 4 0 . 2}$ (also, $\mathrm{P}=\mathrm{MOM}$ gave the same result) which cyclizes spontaneously to give the pyran ring (S40.3) without observing SDE (Scheme 38). These results led us to conclude that there is, surprisingly, a stable SDE (S40.1) formation upon oxidation of these types of allenes.

Scheme 40 Oxidation of Epimeric Allenes

The different behavior of these allenes upon oxidation and the unusual stability of the resultant SDEs could be rationalized from the conformational preferences of the SDEs shown in Scheme 41. The resistance of SDE toward cyclization could be due to both stabilization of conformer S41.1a via favorable intramolecular hydrogen bonding and possible destabilization of reactive conformer S41.1b by steric interactions between alkyne and SDE. In the case of the epimeric allene (S40.2) oxidation, the reactive conformer S41.2b, which led directly to pyranone (S.41.2), would be favorable because the other conformer (S41.2b) suffers form severe steric interactions. Therefore, the cyclization of $\mathbf{S 4 1 . 2 b}$ would take place faster than $\mathbf{S 4 1 . 1 a}$. MeOH may act to disrupt hydrogen bonding in S41.1a and promote cyclization. Additionally, the side products resulting from opening of $\mathbf{S 4 1 . 1}$ with MeOH was observed in low yield $(<10 \%)$.

Scheme 41 Stable SDEs

## III. Synthesis of the Rawal Intermediate

We targeted compound S18.5 (Scheme 18) in the Rawal mycalamide synthesis in order to show a novel approach to access the trioxadecalin ring systems in the pederins, which would also enable us to clarify the relative configuration of the product (S38.3) obtained from DMDO oxidation of the key allene (S37.3). The $\mathbf{S 3 8 . 3}$ was selectively reduced with sodium triacetoxyborohydride to give the trans diol ( $\mathbf{S 4 2 . 1}$ ) as the major product in $74 \%{ }^{14}$ The hydroxyl group distal to the neopentyl center was selectively protected with a MOM group to give $\mathbf{S 4 2 . 2}$ in $60 \%$ yield. The second protection furnished almost quantitatively $\mathbf{S 4 2 . 3}$. Hydroboration and then oxidation of $\mathbf{S} 42.3$ gave rise to aldehyde S42.4, which was exposed to a Wittig ylide to give the alkene (S18.5). Based on ${ }^{1} \mathrm{H}$ NMR matching, the relative stereochemistry of the pyranone $\mathbf{S 3 8 . 3}$ and the diol S42.1 was proven to be correct.

## Scheme 42 Synthesis of the Rawal Intermediate

## IV. Completion of the Formal Synthesis of Psymberin

In order to convert the carbonyl group in $\mathbf{S 3 8 . 3}$ to a methylene, the known procedures such as hydrazine and dithiane formation were applied. But these conditions failed to give desired product formation. Nonetheless, removal of the ketone was accomplished from the pyranone (S38.3) in three steps. First, S38.3 was selectively reduced to diol S42.1 as shown in Scheme 42. Second, S42.1 was converted to epoxide S43.1 by treatment with tosyl chloride and NaH in wet THF (Scheme 43). For the direct epoxide formation, it is required to use wet THF, otherwise, the monotosylation of the alpha hydroxyl group in $\mathbf{S 4 2 . 1}$ was observed, which could subsequently be converted to the epoxide upon treatment with NaH in wet THF. The different reactivity of both the hydroxyl groups in tosylation reaction may result from sterics. The $\mathrm{S}_{\mathrm{N}} 2$ type displacement of tosylate with the $\beta$-hydroxyl anion is geometrically suitable to form epoxide S43.1. Finally, reductive opening of S43.1 by DIBAL provided the alcohol (S43.2). ${ }^{15}$ The yield of the DIBAL reaction depends on the reaction time $(80 \%$, in 1 h$)$. Longer reaction times could cause cleavage of the TBDPS group and reduction of the alkyne to an alkene at the same time. $\mathbf{S 4 3 . 1}$ was protected with MOM to give $\mathbf{S 4 3 . 3}$ in high yield. Hydroboration/oxidation of $\mathbf{S 4 3 . 3}$ gave rise to aldehyde $\mathbf{S 4 3 . 4}$, which was exposed to aldol reaction conditions to afford the major syn product ( $\mathbf{S 4 3 . 5}$ ) in $93 \%$ yield. ${ }^{16}$ The formal synthesis of the psymberin was completed by Dr Shangguan. Briefly, conversion of $\mathbf{S 4 3 . 5}$ to Weinreb amide $\mathbf{S 4 3 . 6}$, protection with a TES group and then reduction of the amide set the aldehyde (S43.7) for another crucial step, which was coupling with an arene partner to form the dihydroisocumarin ring. ${ }^{17}$

## Scheme 43 Completion of Pyran Unit

To construct the dihydroisocumarin ring, we envisioned a combination of the pentasubstituted arene (S29.8, Scheme 29) with an aldehyde in a single step. To do this, the ortho-toluate carbanion generated from $\mathbf{S 2 9 . 8}$ with base reacts with an aldehyde to give rise to the lactone. ${ }^{18}$ Generation of similar types of carbanions and reaction with different electrophiles such as Weinreb amides and esters are reported in the literature. ${ }^{19}$ In particular, the Staunton group demonstrated formation of a lactone ring along with the side products from coupling of an aldehyde with a simple $O$-toluate carbanion. ${ }^{17 e}$

The synthesis of the arene commenced with the transformation of dimedone (S44.1) to the aromatic product (S44.2, Scheme 44). Von Doering first reported the reaction by using acetic acid anhydride and sulfuric acid. ${ }^{20}$ However, Nelson's group optimized it by using trifluoroactic anhydride. ${ }^{21}$

## Scheme 44 Aromatization of Dimedone

A reasonable mechanism of the interesting aromatization is given in Scheme 45. The key features of the mechanism are the addition of a sulfonium cation generated from sulfuric acid and trifluoroacetic anhydride to $\mathbf{S 4 5 . 1}$ to generate cationic intermediate $\mathbf{S 4 5 . 2}$. After deprotonation, evolution of $\mathrm{SO}_{2}$ from $\mathbf{S 4 5 . 3}$ takes place to generate $\mathbf{S 4 5 . 4}$. 1,2 methyl migration followed by aromatization afforded $\mathbf{S} 45.6$, which gave the desired product after basic hydrolysis.

Scheme 45 Mechanism of Aromatization

The next step was the formylation of $\mathbf{S 4 4 . 2}$ by applying the Vilsmeier-Haack reaction. ${ }^{22}$ The arene (S44.2) was exposed to phosphorous oxychloride and DMF in acetonitrile. Even though the yield of the reaction is $46 \%$, this condition was safer than
the Gatterman reaction, in which hazardous reagents like zinc cyanide and hydrochloric acid are used. ${ }^{23}$ The resulting hydroxyl aldehyde ( $\mathbf{S 4 6 . 1}$ ) was masked as a MOM ether, oxidized to the carboxylic acid, and converted to the methyl ester (S46.2). The yield of the reaction sequence was $86 \%$ after three steps.

Scheme 46 Formation of Arene S44.2

In order to see the formation of $O$-toluate carbanion formation, S46.2 was treated with LDA at low temperature (Scheme 45). The deep red color indicated enolate formation (S47.1). Addition of TMSCl gave $\mathbf{S 4 7 . 2}$. In addition, the studies showed the MOM protection group was stable, while the silyl and Bn protecting groups did not survive under the reaction conditions.

Scheme 47 Anion Formation from Arene S42.2

To couple $\mathbf{S 4 7 . 2}$ and $\mathbf{S 4 3 . 7}$ in the real system, the anion generated from $\mathbf{S 4 4 . 2}$ by treatment with LDA at $-78{ }^{\circ} \mathrm{C}$ was slowly added to the precooled aldehyde (S43.7) solution in THF. The inverse and slow addition of $O$-toulate carbanion was preferred to
diminish the side product, which formed from the addition of carbanion to the corresponding lactone product ( $\mathbf{S 4 8 . 1}$ ). The coupling reaction gave $\mathbf{S 4 8 . 1}$ as the major product predicted according to the Felkin-Ahn model in a ratio of 3.5 to $1(64 \%$ yield, $94 \% \mathrm{brsm})$. Gratifyingly, the formation of the dihydroisocumarin ring from the coupling of the pentasubstituted arene $\mathbf{S 4 7 . 2}$ and complex aldehyde $\mathbf{S 4 3 . 7}$ represented the most sophisticated example to date. Removal of all MOM and TES protecting groups followed by acetylation furnished $\mathbf{S 4 8 . 2}$ in $75 \%$ yield over 2 steps. ${ }^{24}$ Cleavage of the TBDPS group and then oxidation gave the aldehyde (S48.3) in $74 \%$ yield after 2 steps. Oxidation of S48.3 to a carboxylic acid and then amidation gave rise to amide $\mathbf{S 4 8 . 4}$, which has identical ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$ NMR and optical rotation to the earlier data reported by De Brabander. The formal synthesis of psymberin was accomplished. ${ }^{25}$

Scheme 48 Completion of Formal Synthesis

## IV. Spirodiepoxides in Psymberin Synthesis: $2^{\text {nd }}$ generation

The synthesis of the right segment of psymberin was accomplished in 25 steps from known aldehyde (S33.1, Scheme 33). Our novel strategy demonstrated the oxidation of comparatively complex allene chemo-, regio-, and stereoselectively. The facile intramolecular opening of the resulting SDE to form six-membered cyclic ether represented the first application in the synthesis of complex molecules. Moreover, construction of a dihydroisocumarin ring from complex partners proved to be an elegant and efficient method. In light of these promising results, the synthesis of $\mathbf{S 4 9 . 1}$ was envisioned from the $\operatorname{SDE}(\mathbf{S 4 9 . 2})$ derived from oxidation of a more functionalized allene S49.3 (Scheme 49). This would enable us to reach the target more directly and advance our understanding of the functional and protecting group compatibility of SDE chemistry. Moreover, the trend for the preference of epoxide opening has been studied in detail and found to be 5 -exo $>6$-exo $>6$-endo. However, the trend for SDE cyclization has not been well established. Therefore, the oxidation of $\mathbf{S 4 9 . 3}$ and exo vs endo opening in the presence of multiple hydroxyl groups is of interest. In the case of allene $\mathbf{S 4 9 . 3}$, it would be expected that 6 -endo mode would be favorable over the neopentyl-like 6 -exo cyclization despite the fact that 6-exo is more preferable in unbiased epoxide systems. The competition between the two modes, which could lead to complex mixtures of products, could be resolved if one of the hydroxyl groups was protected.

## Scheme 49 Synthetic Strategy for $2^{\text {nd }}$ Generation

In related synthetic studies toward FR900482 mitomicinoids, the Williams group found that oxidation of the complex allene with DMDO gave several products, presumably due to deterioration of arene moiety. ${ }^{3 a}$

## Scheme 50 DMDO Oxidation of Allene in FR Synthesis

In order to prevent this problem for allene $\mathbf{S 4 9 . 3}$, the stability of arenes with MOM (S51.1) and acetate (S51.2) protecting groups under oxidation conditions were tested (Scheme 51). When $\mathbf{S 5 1 . 1}$ was treated with DMDO, many products were observed within 10 min . However, $\mathbf{S 5 1 . 2}$ was stable even after 24 hours. This different behavior could be reasoned from the nature of protecting groups, where an electron withdrawal acetate group could decrease the reactivity of an otherwise electron rich arene toward DMDO. ${ }^{26}$

## Scheme 51 Stability of Arenes

It was observed that PMB and Bn protecting groups may be cleaved under oxidation conditions. Therefore, this problem as well as protecting group compatibility prompted us to revise the second generation synthesis of psymberin. Our interest was to prepare an allene without an arene unit, which may not cause the above-mentioned problems. We envisioned that allene ( $\mathbf{S 4 9 . 3}$ ) would be accessed from $\mathbf{S 5 2 . 1}$, which could be prepared from two simpler units; the allenyl aldehyde (S52.3) and a ketone (S52.3). Coupling of the two units could be achieved via the Paterson aldol condition. ${ }^{27}$ The reagent controlled reduction of a ketone followed by selective protection of the hydroxyl group would generate the allene, ready for DMDO oxidation.

## Scheme 52 Revised $2^{\text {nd }}$ generation Strategy

The known ketone (S53.3) was prepared in 3 steps from the chiral methyl ester (S53.1). TBS protection gave S53.2, which was converted to a Weinreb amide and then ketone (S53.3) in 82\% yield after 2 steps (Scheme 53).

## Scheme 53 Synthesis of Ketone S53.3

After a solution of $\mathbf{S 5 3 . 3}$ in diethyl ether was treated with $\mathrm{NEt}_{3}$ and $\mathrm{Cy}_{2} \mathrm{BCl}$ at low temperature, a solution of allene aldehyde (S37.1, Scheme 37) in the same solvent was added to the reaction mixture at $-78^{\circ} \mathrm{C}$. The resultant alcohols were separated by FCC, providing the major product ( $\mathbf{S 5 4 . 1}$ ) in 74\% yield, and $\mathbf{S 5 4 . 2}$ in 11\% yield (dr; 7:1). The high selectivity of the substrate directed aldol reaction using an achiral borane reagent has been explained with a transition state model (S54.3) by the Paterson group. In the proposed chair-like transition state, the large R group of a ketone is positioned in such a way as to minimize destabilizing steric intereactions. ${ }^{25}$ The efficiency and reliability of the reaction was shown in the synthesis of complex molecules by the same group. ${ }^{25 c}$ In order to ensure that the major product had desired configuration, the reaction was repeated with a chiral borane reagent providing $\mathbf{S 5 4 . 1}$ as major product with a higher selectivity ( $<20: 1$ ), albeit in lower yield (30\%).

## Scheme 54 Paterson Aldol Reaction

For the substrate directed asymmetric reduction of ketone S54.1, two different conditions were applied to provide 1,3 syn diol (Scheme 53). Treatment of S54.1 with $(\mathrm{Et})_{2} \mathrm{BOMe}$ and $\mathrm{NaBH}_{4}$ gave $\mathbf{S 5 5 . 1}$ in higher yield and ratio ( $95 \%$, dr:20:1) than $\mathrm{ZnBH}_{4}$ ( $84 \%, 10: 1$ ). The hydroxyl group distal to the neopentyl center in $\mathbf{S 5 5 . 1}$ was selectively protected with either TBSOTf or alternatively with TBSCl to yield S55.2. Yields were not optimized.

Scheme 55 Asymmetric Reduction of Hydroxyl Ketone

Unfortunately, the oxidation of $\mathbf{S 5 5 . 2}$ with DMDO gave rise to a mixture of products. Even though the electron spray mass spectroscopy indicates the molecular ion peak corresponding to the desired product, it was very difficult to isolate out from the reaction mixture. Also, addition of MeOH and inverse addition did not work. Likewise, the oxidation of S54.1, structurally similar to $\mathbf{S 5 5 . 2}$, produced the same result. However, the oxidation of $\mathbf{S 5 4 . 2}$, epimeric to $\mathbf{S 5 4 . 1}$, furnished the cyclic ether ring ( $\mathbf{S 5 6 . 1}$ ) in $40 \%$ yield. The product was fully characterized. Separation and characterization of products from DMDO oxidation of $\mathbf{S 5 5 . 2}$ and $\mathbf{S 5 4 . 1}$ would enable us to rationalize the behavior of the two similar allene $\mathbf{S 5 4 . 1}$ and $\mathbf{S 5 4 . 2}$, but it was a very difficult process. This route was not further pursued because of these unexpected results.

## Chapter IV

## Direct Carbinolamide Synthesis

## I. Introduction

The elegant synthesis of both the core ring with the application of SDE and the dihydroisocumarin ring were accomplished in order to reach the target molecule, psymberin. These novel and flexible strategies could also enable us to synthesize analogs and hybrid structures of psymberin. The last synthetic challenge posed by this complex molecule is to construct, efficiently and stereoselectively, the unique $O$-alkyl carbinolamide functional group (Figure 2, p2). Presumably, this group plays a significant role in the biological activity of the pederin family members. A probable mechanism for the biological action is eliminative cleavage of the C-O bond giving rise to an acylimine which could act as an alkylating agent.

In chapter 2 the synthetic strategies for the fragments of the pederin family members were discussed. These fragments are bridged by the $O$-alkyl carbinolamide. There are several creative methods reported for the construction of this motif. Among them, the Matsumoto and Roush methods, which are the most widely used, will be discussed in this chapter. In addition, the Huang group recently reported the total synthesis of psymberin and their approach will be mentioned here. Our group devised a different approach to build this highly sensitive motif and is applying it to the synthesis of analogs.

In the late 80 's, the Matsumoto group developed an outstanding strategy to form

O-methyl carbinolamides, which was demonstrated in the first total synthesis of pederin. In this strategy, an amide (S57.1) is treated with trimethyloxonium tetrafluoroborate to give rise to an imidate (S57.2), which is subjected to an acyl chloride (S57.3) and a base to afford $N$-acyl imidate (S57.4). The resulting $\mathbf{S 5 7 . 4}$ is readily reduced in situ with $\mathrm{NaBH}_{4}$ in alcoholic solvents to the carbinolamide (S57.5). Although studies for the model and real systems afforded the motif in high yields, this approach suffered from poor stereoselectivity in product formation. For example, the pederin was obtained in a 1:3 ratio (desired:undesired) after the employment of this strategy in their total synthesis. Nevertheless, this synthetic method has been employed by several other groups to achieve both the synthesis of pederin and its analogs.

## Scheme 57 The Matsumoto Strategy

The De Brabander group recently applied the Matsumoto method in the total synthesis of psymberin. They prepared the amide (S58.1) and acyl chloride (S58.2) partners and combined them under the Matsumoto condition to get $O$-methyl protected carbinolamide. Albeit capricious, they found that polyvinyl pyridine base appeared to be uniquely effective among amine bases. After basic hydrolysis of the acetate and benzoate protecting groups, they obtained the natural product (S58.3) and its epimer in a 2.5 to 1 ratio. The yield was $56 \%$ based on recovered $\mathbf{S 5 8 . 1}$.

## Scheme 58 The De Brabander Synthesis of Psymberin

Another creative strategy was developed by the Roush group and employed in their total synthesis of mycalamide A. In this strategy, $\mathbf{S 5 9 . 1}$ was converted to a carbamate (S59.3) through Curtius rearrangement of S59.2 with diphenylphosphoryl azide in the presence of TMS ethanol. The resulting $\mathbf{S 5 9 . 4}$ was then deprotonated with base and captured with an acyl chloride to give an $N$-acyl product (S59.5). Exposure of S59.5 to the TBAF removed the trimethylsilylethoxy carbonyl (Teoc) group to readily afford the desired functionality (S59.6). The most striking feature of this method is complete stereocontrol. No epimerization is observed under the reaction conditions. Several other groups have applied this method successfully in the synthesis of the pederin family members.

## Scheme 59 The Roush Strategy

The Huang group developed an interesting method for the motif and applied it to the synthesis of psymberin. They converted an $N$-acyl enamine (S60.1) to the corresponding pyran (S60.2) using $\mathrm{PhI}(\mathrm{OAc})_{2}$ as oxidant in a single step. They also investigated the likely mechanism of the reaction during the optimization and reported two possible pathways to product formation. For the synthesis of psymberin, they prepared precursor S60.3 and treated it with the oxidant, which afforded a total yield of $72 \%$ of isolated products. The desired product (S60.4) was isolated in 30\% yield among the four diastereomers. After protecting group manipulations and double bond formation in the acyclic side chain ( 5 steps), they completed the total synthesis of the natural product. Although this transformation leads to product formation very quickly, the selectivity is poor. Additionally, the reaction conditions may not be suitable for some functional groups, e.g. other C-C double bonds.

## Scheme 60 The Huang Strategy

## II. Direct Aldehyde-Amide Coupling

We completed a formal synthesis of psymberin. To complete total synthesis we could apply the Matsumoto coupling. However, the reported approaches to $O$-methyl carbinolamide formation require multi-step processes. We felt that a direct method that leads to formation of the motif stereoselectively is necessary. We envisioned that the desired motif would be accessible from methylation of a carbinolamide (S61.3), which would be in turn derived from a direct coupling of an amide (S61.1) and an aldehyde (S61.2). In the literature, direct coupling of two partners had been reported, but it was limited to only electron poor aldehydes and required relatively harsh conditions. ${ }^{1}$ There are also indirect approaches reported for the motif formation. ${ }^{2}$

## Scheme 61 Direct Aldehyde-Amide Coupling

During the total synthesis of zampanolide, the Hoye group disclosed an approach that involved coupling an aldehyde (S62.3) with the metal imidate (S62.2) derived from an amide (S62.1) and DIBAL (Scheme 62). ${ }^{3}$ This reaction was the first example of the direct coupling of two partners under mild conditions. However, they obtained a mixture of products (S62.4) in a ratio of 1: 1and no yield was reported.

Scheme 62 The Hoye Synthesis of Zampanolide

We anticipated that the complex aldehyde (S63.2) could be coupled with the complex amide (S63.1) under the same conditions to afford the corresponding carbinolamide. Unfortunately, the reaction failed to give the desired product. Consequently, we studied this reaction in more detail in terms of generality, reliability, and efficiency. In addition, the stereoselectivity issue must also be addressed.

## Scheme 63 Direct Coupling of Amide S63.1 and S63.3

In principle, addition of an amide anion to an aldehyde represents a type of aldol reaction, which is one of the most studied reactions in organic chemistry. Aldol reactions have been efficiently and reliably applied in complex synthesis and provided stereoselective product formation under reagent or substrate controlled reaction conditions. ${ }^{4}$ The enolates can be formed with different metals such as $\mathrm{Li}, \mathrm{B}, \mathrm{Ti}, \mathrm{Sn}$. Hence, we expected that different metal imidates could be generated from amides
coupled with aldehydes to provide carbinolamides. Boron imidates represent an alternative approach.

## III. Results for Boron Imidates with Aldehydes

We applied the Paterson aldol reaction conditions to couple hexanamide (S64.1) and cyclohexanecarbaldehyde (S64.2). ${ }^{5}$ Thus, $\mathbf{S 6 4 . 1}$ (1.2 eq) was taken up in diethyl ether ( 0.2 M ) and $\mathrm{NEt}_{3}$ ( 2.0 eq ) was then added. After cooling to $0{ }^{\circ} \mathrm{C}$, dicyclohexylboron chloride ( $1.3 \mathrm{eq}, 1.0 \mathrm{M}$ in hexane) was added. The heterogeneous mixture was stirred for 15 min and then $\mathbf{S 6 4 . 2}$ (1.0 eq) was added. After 30 minutes the reaction was quenched with a mixture of $\mathrm{MeOH} / \mathrm{phosphate}$ buffer $(\mathrm{ph}=7.40) / \mathrm{H}_{2} \mathrm{O}_{2}(30 \%)$. Isolation and purification gave the carbinolamide ( $\mathbf{S 6 4 . 3}$ ) in $88 \%$ yield.

## Scheme 64 Simple Aldehyde and Amide Coupling

Presumably, boron imidate formation takes place under the reaction conditions and then couples the aldehyde. We then turned our attention to optimize product formation. In table 2, the yields were given with different equivalents of amide (T2.1), aldehyde (T3.2), $\mathrm{Cy}_{2} \mathrm{BCl}$, and $\mathrm{NEt}_{3}$. Using either a slight excess of the imidate or aldehyde gave the same yield (entry 1-3 and 7). Finally, the yield did not change with excess imidate (entry 4, 5 and 6). As a result, entry 1 and 7 gave the optimal conditions. The solvent $\mathrm{Et}_{2} \mathrm{O}$ was found to be a good choice since $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, THF, and $\mathrm{CH}_{3} \mathrm{CN}$ gave
the yields of $75 \%, 54 \%, 23 \%$, respectively. Also, using the $(n B u)_{2} B O T f$ for imidate formation did not improve the yield.

Table 2 Optimization of Coupling Reaction

Several aldehydes and amides were coupled. The findings are tabulated in Scheme 65. The primary amides coupled readily with an aldehyde to give the carbinolamides (S65.1, S65.2, S65.3) in moderate yields. Interestingly, the cyclic amides (S65.5, S65.6) appeared to be unreactive, while the five-membered cyclic amide (S65.4) furnished the product in $87 \%$. Also, carbamate (S65.7) and thioamide (S65.9) did not provide product. Unsaturated amides ( $\mathbf{S 6 5 . 9}$ and $\mathbf{S 6 5 . 1 0}$ ) were found to form the carbinolamide, albeit in low yields (less than 20\%). Moreover, products formation was traceable on TLC for secondary amides ( $\mathbf{S 6 5 . 1 1}$ and $\mathbf{S 6 5 . 1 2}$ ), but the isolation was difficult since they reformed the starting materials during column separation.

## Scheme 65 Examples of Aldehyde-Amide Coupling

S65.3, 79\%, $1: 1$

S65.2, 71\%

S65.4, 87\%

S65.12

We also investigated stereoselective carbinolamide formation. For this matter, (-)$(\mathrm{Ipc})_{2} \mathrm{BCl}$ was used for coupling of the amide (T2.1) and the aldehyde (T2.2). ${ }^{6}$ The reaction yield of the coupling was $87 \%$ after isolation of product (T2.3). Chiral HPLC analysis indicated that the enantiomeric excess of the reaction was $18 \%$. The product was column chromatographed a second time to determine if epimerization occurred during column purification, but the ee was the same as before. The reaction was carried out by using $\mathrm{Cy}_{2} \mathrm{BCl}$ at low temperatures such as $-78,-40$ and $-20^{\circ} \mathrm{C}$. Unfortunately, no product formation was observed.

Much more research needs to be done to fully understand this reaction. In a reagent controlled aldol reactions, it is known that the selectivity results from the formation of a chair-like Zimmerman-Traxler transition state. ${ }^{6}$ It is likely that this reaction follows the same mechanism.

## IV. Complex Amide and Aldehyde Coupling: Analogs

We wanted to prepare analogs of psymberin to understand its mode of biological action. In addition, we wanted to investigate our new coupling reaction. The complex
amides ( $\mathbf{S 6 6 . 2}$ and $\mathbf{S 6 6 . 3}$ ) were prepared from the hydroxyl carboxylic acid ( $\mathbf{S 6 6 . 1}$ ) in 2 steps.

## Scheme 66 Preparation of Complex Amides

The preparation of complex aldehydes starts with the alcohol (S43.2), which was first protected as the acetate to afford S67.1. Then, deprotection of TBDPS followed by oxidation under Swern conditions gave rise to aldehyde S67.2 Similarly, reduction of the alkyne (S67.1), deprotection of TBDPS and then oxidation under Swern conditions yielded aldehyde S67.4. Interestingly, the coupling constant analysis indicated that the aldehyde group is positioned axially in $\mathbf{S 6 7 . 2}$ and equatorially in $\mathbf{S 6 7 . 4}$, which may lead to differences in reactivity. In particular, the aldehyde (S67.4) would be useful as both it and $\mathbf{S 6 3 . 2}$ contains a similar chain on the pyran ring.

For the preparation of aldehyde $\mathbf{S 6 7 . 5}$, the diol ( $\mathbf{S 4 2 . 1}$ ) was first protected as the diaceate, deprotected with TBAF and then oxidized with DMP. The epoxide S43.1 is deprotected with TBAF and oxidized to the aldehyde (S67.6). Both aldehydes were prone to $\beta$-elimination under oxidizing conditions. Therefore, they were used immidiatley after they were formed.

## Scheme 67 Complex Aldehydes Preparation

The findings from coupling of complex amides and aldehydes are given in Scheme 68. The union of the complex amide with cyclohexanecarbaldehyde efficiently took place under our conditions to give a mixture of separable carbinolamides (S68.1) in $66 \%$ yield (dr 1:1). Amides $\mathbf{S 6 6 . 2}$ and $\mathbf{S 6 6 . 3}$ coupled with the aldehyde $\mathbf{S 6 7 . 2}$ with almost the same yield (S68.2 and S68.3), indicating no effect from the protecting groups. Similarly no significant influence was observed from the pyran side chain (S68.4).

## Scheme 68 Examples of Complex Amide and Aldehyde Coupling

(S68.1, 66\%, dr 1:1)

(S68.3, 40\%, dr 1:1)

(S68.4, 40\%, dr; 2:1)

The pyran aldehydes (S67.5 and S67.6) failed to give the corresponding carbinolamides under the coupling conditions. Instead of addition, $\beta$-elimination in the aldehydes took place to form compounds $\mathbf{S 6 9 . 1}$ and $\mathbf{S 6 9 . 2}$. The Rawal group reported the same type of decomposition of similar aldehydes. ${ }^{7}$ Compound $\mathbf{S 6 9 . 1}$ was further treated with the imidate formed from the amide, but no product was observed.

Scheme 69 Elimination Products

S69.2

## V. Stability of Carbinolamides

It is reported that the carbinolamides are inherently unstable functional groups and readily decompose to amide and aldehyde. However, the Porco and Bussolari groups
demonstrated that certain carbinolamides (S70.1 and S70.2, Scheme 70) were unexpectedly stable, and even isolable by chromatography. ${ }^{8}$ They proposed that the stability of these molecules resulted from extended hydrogen bonding, provided by a heteroatom positioned appropriately to act as a hydrogen bond acceptor. The Porco group showed experimentally that there was an interaction between the carbonyl group and the amide hydrogen, and they suggested that this is necessary for the stability. ${ }^{10 b}$ The presence of this interaction was supported by ${ }^{1} \mathrm{H}$ NMR since the peak exhibited by the hydrogen bonded NH appears at more downfield than that of the non-hydrogen bonded NH. Additionally, the stability of zampanolide (S62.4) was rationalized by invoking an intramolecular hydrogen-bond network, similar to S70.2. ${ }^{9}$

## Scheme 70 Stable Carbinolamides

S70.1

S70.2

Although the hydrogen bond network is apparent in S70.1 and S70.2, it has not been established as necessary. We believe this notion must be reevaluated based on the results we obtained during the application of our new condition for carbinolamide syntheses. We were able to isolate, characterize and manipulate the carbinolamides, which were devoid of hydrogen bonding interactions. Particularly, S64.3, T2.3, S65.1, S65.2 and S65.4 derived from simple aldehydes and amides exhibited unexpected stability under the reaction conditions, and accommodated aqueous work-up, flash column chromatography, routine handling, and storage. Moreover, the Smith group
demonstrated $O$-alkylation of the zamponilide carbinolamide did not any reduce the stability of the product. ${ }^{11}$ Similarly, we methylated the carbinolamide S64.3, and not surprisingly isolated the stable $\mathbf{S 7 1 . 1}$ (Scheme 71), which lacks of the stabilizing hydrogen bonding network. In light of these results, carbinolamides appear intrinsically stable, even in the absence of the intramolecular stabilizing interactions.

## Scheme 71 Methylation of the Carbinolamide S64.3

## VI. Scope of the Boron Imidates

Normally, an amide could couple with an aldehyde either under harsh condition or when the aldehyde is electron poor. We demonstrated that the nucleophilicity of an amide increases when it is transformed to an imidate since the union with aldehydes took place smoothly under mild conditions. Likewise, we wanted to investigate the coupling of boron imidates with different electrophiles, which may lead to a variety of nitrogen containing functionality. For this purposes, the boron imidates were treated with such electrophiles as benzyl bromide, allyl tosylate, benzenesulfonyl chloride, benzoyl chloride, phenyl isocyanate, styrene as well as Micheal acceptors like cyclohexenone, 1nitrocyclohexene and phenyl vinyl sulfone. Unfortunately, all were nonreactive to a boron imidate. Apparently, the nucleophilicity of a boron imdate too low to react with these electrophiles.

In order to increase of imidate nucleophilicity we tried borane reagents with
electron drawing groups like pinacol borane chloride and. But, the reactivity of the imidate was not improved. We turned our focus to the imidates of different metals. We tried $\mathrm{AlMe}_{2} \mathrm{Cl}, \mathrm{AgOTf}, \mathrm{Sc}(\mathrm{OTf})_{3}, \mathrm{SnCl}_{4}, \mathrm{Zn}(\mathrm{OTf})_{2}, \mathrm{MgBr}_{2} . \mathrm{OEt}_{2}$. Unfortunately, all of these attempts failed to increase the yield of the carbinolamide product.

## Chapter V

## Metal Promoted Thioacid-Azide Coupling

## I. Introduction

Our group investigated the reaction of thioacid-azide coupling, which gives an amide. ${ }^{1}$ The amidation was shown to be effective in water and organic solvents. Moreover, the reaction was applied to a variety of thioacids and azides to obtain simple and complex amides, which were difficult to obtain by using conventional methods. ${ }^{\text {1a }}$

The reactivity of amidation depends on the electronic character of azides. The coupling of thioacids with electron poor azides approaches the ideal reaction profile, including short, room temperature reactions that give near quantitative yields, while electron rich azides require higher temperatures and longer reaction times. Some representative examples of both azides are given in Scheme 72.

Scheme 72 Examples of Electron Rich and Poor Azides
ELECTRON POOR
ELECTRON RICH

The experimental and computational data revealed two reaction pathways. ${ }^{\text {1d }}$ For electron poor azides, it is a stepwise process, initially forming a nitrogen-sulfur bond, a
carbon-nitrogen bond forms in a separate step to give the thiatriazoline intermediate after protonation. The thiatriazoline intermediate decomposes to the amide product, nitrogen and sulfur via retro-[3+2] cycloaddition.

## Scheme 73 Mechanism for Electron Withdrawing Azides

For electron rich substrates, it is a concerted process: carbon-nitrogen and sulfurnitrogen bond formation takes place in a single step by anion-accelerated [3+2] cycloaddition. This give rise to the anion, after which protonation forms a thiatriazoline intermediate, which gives the amide product along with nitrogen and sulfur through the same mechanism.

## Scheme 74 Mechanism for Electron Rich Azides

We hypothesized that a suitable metal would promote the reaction of electron rich azides with thioacids, as there is literature precedent that a metal can accelerate the [3+2]
cycloaddition. ${ }^{2}$ Our goal was to facilitate the coupling of electron rich azides at room temperature in a conveniently short timeframe. We selected benzyl azide (S75.2) and thiobenzoic acid (S75.1) as our test substrates. Benzyl azide is a good model of electron rich primary azides and thiobenzoic acid is a good model of thioacids. Under the original conditions developed by our group, this reaction required 15 hours in refluxing chloroform to form the amide (S75.3) in 85\% yield. Addition of trimethyl silyl triflate to thiobenzoic acid and triethyl amine or 2,6-lutidine effected complete conversion to trimethyl silyl thionobenzoate (S75.4). The silylation could be conveniently followed by ${ }^{13} \mathrm{C}-$ NMR. Thus, the 190 ppm signal apparent for thiobenzoic acid disappeared and a new signal at 213 ppm became evident within minutes. Subsequent treatment of thiobenzoic acid with benzyl azide failed to give rise to the corresponding amide (S75.3) product at room temperature with no measurable improvement at $60^{\circ} \mathrm{C}$ ( $<4 \%$ after 20 hrs ).

## Scheme 75 Coupling of Thioacid and Thionoester with Azide

The Wong group found that the amidation reaction could be promoted in the presence of $\mathrm{RuCl}_{3}$ and 2,6-Lutidine under mild conditions. ${ }^{3}$ They showed the coupling of thioacetic acid with a limited set of electron rich azides to furnish acetamide products. We applied the same amidation conditions to our substrates; thiobenzoic acid and benzyl
azide. However, it provided the product in just $14 \%$ yield. Moreover, we examined $\mathrm{RuCl}_{3}$ promoted coupling of thiobenzoic acid with $\mathbf{S 7 5 . 1}$ and $\mathbf{S 7 5 . 4}$ (thionoester) in the absence of base, but the yields were $27 \%$ and $14 \%$, respectively. Therefore, we believe that $\mathrm{RuCl}_{3}$ may not be the best choice for a metal promoter and also that these conditions are not general for thioacid and azide couplings. We thus screened Lewis acids in search of a promoter that would induce amidation within hours at room temperature.

During the initial investigations, the thionoester derived from thiobenzoic acid was used since the carbon sulfur double bond could function as a dipolarophile in [3+2] cycloaddition reaction. Our findings are tabulated in Table 3. We set out with the copper metals as they are known to facilitate the cycloaddition reaction of azides. ${ }^{4}$ Unfortunately, they furnished the product in very low yields (entry 1 to 11 ), even in the presence of a ligand (entry 7 and 8 ). Similarly, most of the metals we tried did not provide the product (entry 12 to 24). In contrast, iron (II) chloride along with such bases as DMAP and 2,6 Lutidine gave S75.3 in promising yields. However, the yields were not improved in the presence of different bases and with different stoichometric amounts of starting materials.

| 26 | $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ | 1.0 | 1.0 | $\mathrm{FeCl}_{2}(1.0)$ | Lutidine(1.0) | 41 | 6 |

The findings from the iron (III) chloride are given in Table 4. We obtained $35 \%$ yield with 0.5 equivalent of the metal (entry 1), which was improved to $52 \%$ in the presence of DMAP ( 0.5 eq ) after screening many different bases (entry 2 ). This was the highest yield up to this point. We proceeded to optimize the reaction by changing the amount of the substrates. Doubling the amount of either the thionoester (S75.4) or the
benzyl azide did not affect the yield (entry 3 and 4). Using 1.0 equivalent of both metal and base increased the yield slightly (entry 4). The largest increase in yield occurred when using 2.0 equivalents of both $\mathrm{FeCl}_{3}$ and DMAP (entry 6). Under these conditions, doubling the amount of the azide afforded the highest yield ( $82 \%$ ) in the shortest time (entry 7). Methylene chloride was used as solvent for all presented data.

## Table 4 Results from Iron (III) Chloride and Thionoester Coupling

| Entry | S75.4 (eq) | BnN3 | Metal (eq) | Base (eq) | Yield (\%) | Time (h) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 1.0 | 1.0 | $\mathrm{FeCl}_{3}(0.5)$ | no | 35 | 7 |
| 2 | 1.0 | 1.0 | $\mathrm{FeCl}_{3}(0.5)$ | DMAP $(0.5)$ | 52 | 7 |
| 3 | 2.0 | 1.0 | $\mathrm{FeCl}_{3}(0.5)$ | DMAP $(0.5)$ | 50 | 7 |
| 4 | 1.0 | 2.0 | $\mathrm{FeCl}_{3}(0.5)$ | DMAP $(0.5)$ | 42 | 7 |
| 5 | 1.0 | 1.0 | $\mathrm{FeCl}_{3}(1.0)$ | DMAP $(1.0)$ | 56 | 6 |
| 6 | 1.0 | 1.0 | $\mathrm{FeCl}_{3}(2.0)$ | DMAP $(2.0)$ | 71 | 3 |
| 7 | 1.0 | 2.0 | $\mathrm{FeCl}_{3}(2.0)$ | DMAP $(2.0)$ | 82 | 3 |

All the attempts to further improve the yield of the optimized condition (Table 4 entry 7) such as using other solvents (THF, $\mathrm{Et}_{2} \mathrm{O}, \mathrm{CH}_{3} \mathrm{CN}$ ), changing the order of addition of substrates, and altering concentration were not satisfactory. In addition, longer reaction times did not provide higher yields. The best time of the reaction was found to be 3 h since the yields were $48 \%$ and $62 \%$ after 1 h and 2 h , respectively.

We also applied these conditions (Table 4, entry 7) to thiobenzoic acid in order to see the effect of thionoester on the reaction. Virtually the same yield was obtained when 2.0 equivalents of both $\mathrm{FeCl}_{3}$ and DMAP were used for the coupling of the azide with thiobenzoic acid (Table 5, entry 1). The increased amount of metal and azide did not influence the yield significantly (entry 2 and 3). Interestingly, it was found that DMAP plays a critical role in the amidation, since almost no product formation was observed in
its absence. Therefore, we turned our attention to other bases to understand the role of a base in the coupling.

Table 5 Results from Iron (III) Chloride and Thioacid Coupling

| Entry | S75.1 (eq) | BnN $_{\mathbf{3}} \mathbf{( e q )}$ | $\mathrm{FeCl}_{\mathbf{3}}$ (eq) | DMAP (eq) | Yield (\%) | Time (h) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 1.0 | 2.0 | 2.0 | 2.0 | 78 | 3 |
| 2 | 1.0 | 2.0 | 3.0 | 3.0 | 77 | 3 |
| 3 | 1.0 | 2.0 | 4.0 | 4.0 | 74 | 3 |
| 4 | 1.0 | 2.0 | 2.0 | no | 0 | 18 |
| 5 | 1.0 | 1.0 | 0.5 | no | 9 | 22 |

We focused on the pyridines bearing electron donating groups since they resemble DMAP in terms of electronic structure. The results are given in Table 6. The yields for each thiobenzoic acid (S75.1) and thionoester (S75.4) were obtained by using 2.0 equivalents of both $\mathrm{FeCl}_{3}$ and base in 3 h . Interestingly, the methoxy (entry 1), amino (entry 2 ) and dimethyl (entry 3 ) substituents provided very low yields for the coupling of both S75.1 and S75.4. However, the pyrrolidine group on pyridine (entry 4) gave rise to the amide in almost the same yield as DMAP.

Table 6 Results from Using Different Bases

| Entry | Bases | S75.1 (\% yield) | S75.4 (\% yield) |
| :---: | :---: | :---: | :---: |
| 1 | N-OCH3 | 26 | 9 |
| 2 |  | 27 | trace |
| 3 |  | trace | trace |
| 4 |  | 72 | 72 |
| 5 |  | 78 | 82 |

We also tested different iron halides under the reoptimized conditions (Scheme 76). For this purpose, $\mathrm{FeCl}_{2}, \mathrm{FeBr}_{2}$, and $\mathrm{FeF}_{3}$ were applied to the model system in presence of DMAP. The iron (III) fluoride and iron (II) bromide furnished the product in low yields, while iron (II) chloride gave a modest yield (60\%).

## Scheme 76 Results for Different Iron Halides

Iron (III) chloride and DMAP appear to be a good system for the amidation. Therefore, the optimized condition was applied to a variety of thioacids and azides. For this study, the azides were prepared form the corresponding halides (see table 7 and Scheme 77) and thiobenzoic acid and thioacetic acid were applied as the other coupling partner. The results for some azides are given in table 7. The coupling of the benzyl azide with thioacetic acid furnished the corresponding amide in $62 \%$ yield (entry 1 ). Likewise, substituted benzyl azides formed the products in moderate yields (entry 2 and 3). The imide substituted primary azide also provided the amides (entry 4). The thionoester (S75.4) gave rise to the amides with the electron rich and poor azides (entry 5 and 6), albeit in low yields.

Table 7 Results from Thioacid-Azide Coupling

We prepared the azides shown in Scheme 77, since the corresponding amines could not easily lead to amides by conventional methods. Unfortunately, the optimized condition resulted in decomposition of azides S77.1, S77.2, S77.3, and S77.4. S77.5 was not reactive even after longer reaction times. The azides $\mathbf{S} 77.6, \mathbf{S 7 7 . 7}$, and $\mathbf{S 7 7 . 8}$ coupled to S75.4, but the yields were very low ( $<5 \%$ ).

## Scheme 77 The Azides Failed to Couple

## II. Discussions for the Mechanism of Thioacid-Azide Coupling

Although our findings were not generally applicable, we were still interested in the likely mechanism of the coupling reaction which gives a good yield for certain substrates. We carried out some control reactions. Benzyl amine was not observed. Although reduction of benzyl azide is possible, it is not observed when the benzyl azide is exposed to iron (III) chloride and DMAP (Scheme 78). If benzyl amine is formed, it must be rapidly converted into another substance.

We checked the stability of benzyl azide and thiobenzoic acid under the reaction conditions (Scheme 78). The benzyl azide decomposed upon treatment with iron (III) chloride, yet it survived in presence of $\mathrm{FeCl}_{3}$ and DMAP. We also observed the same pattern for the azides in Scheme 76. Similarly, the thiobenzoic acid was observed to form the dimer (S78.1) slowly over time when treated with either $\mathrm{FeCl}_{3}$ or $\mathrm{FeCl}_{3}$ and DMAP.

## Scheme 78 Control Reactions for Azide and Thioacid

b) $\mathrm{FeCl}_{3}$, DMAP, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$

S78.1

During the optimization studies, we observed by-product formation along with the major amide product. Interestingly, when the yield of the amide (S75.3) jumps from 35\% (Table 4 , entry 1) to $82 \%$ (Table 4 , entry 7 ), the side product formation was significantly diminished. The yields for S79.1, S79.2, and S79.3 were less then $5 \%$ when the highest yield for $\mathbf{S 7 5 . 3}$ was obtained. The structure of these side products was identified in order to investigate their possible relevance to the mechanism of the coupling (Scheme 79). S79.1 and S79.2 were crystallized and structural proof was accomplished by X-ray crystallography. Sulfur (S79.5) was identified by melting point measurement, while the usual spectroscopic methods used for S79.3. In addition to these side products, dimer formation (S78.1) was detected for all data in Table 4 and 5.

Scheme 79 Side and by-Products from Amidation

We checked the importance of the dimer (S78.1), since it forms immediately upon mixing the substrates (Scheme 78). S78.1 and the benzyl azide were exposed to the metal and base. No amide formation was detected after 18 h (Scheme 80).

## Scheme 80 Dimer and Benzyl Azide

We noted that both S79.1 and amide (S75.3) form almost simultaneously under
the amidation reaction conditions. Therefore, we next focused on S79.1. A literature search revealed interesting information about molecules of this sort (Scheme 81). The Alliger group obtained amide $(\mathbf{S 8 1 . 4}, \mathrm{X}=\mathrm{O})$ or thioamide $(\mathbf{S 8 1 . 4}, \mathrm{X}=\mathrm{S})$ and sulfur from oxidative coupling of thioacid $(\mathrm{X}=\mathrm{O})$ or dithioacid $(\mathrm{X}=\mathrm{S})$ salts with cyclohexylamine (S81.2). ${ }^{5}$ They postulated that the reaction proceeded through the unstable $N$-cyclohexyl-$S$-aroylhydrosulfamine (S81.3). Moreover, the Bohme group reported amide (S81.7) and sulfur formation from the reaction of $\mathbf{S 8 1 . 5}$ with diethylamine, which presumably resulted from immediate decomposition of unstable intermediate S81.6. ${ }^{6}$ They also obtained similar results for piperidine and aniline. The Raasch group showed that stable $S$-aroylhydrosulfamines ( $\mathbf{S 8 1 . 1 0}$ ) could be prepared by mixing sodium salts of both thioacids (S81.8) and hydroxylamine- $O$-sulfonate ( $\mathbf{S 8 1 . 9}$ ). ${ }^{7}$ Their conditions corroborate the reported instability of both $N$-alkyl- $S$-aroylhydrosulfamines (S81.3) and $S$ acylhydrosulfamines ( $\mathbf{S 8 1 . 6}$ ) (see intermediates $\mathbf{S 8 1 . 1 3}$ and $\mathbf{S 8 1 . 1 6}$ ). They speculated that the decomposition of $S$-aroylhydrosulfamines to an amide and sulfur could involve a bimolecular process, forming a cyclic intermediate or transition state ( $\mathbf{S 8 2 . 1}$ ). The more basic $N$-alkyl derivatives could readily lead to similar transition states, causing the observed instability of $N$-alkyl- $S$-hydrosulfanamines (S81.3, S81.6, and S81.16). Furthermore, they rationalized the stability of $S$-aroylhydrosulfamines (S81.8), in contrast to their aliphatic analogs ( $\mathbf{S 8 1 . 5}, \mathbf{S 8 1 . 1 5}$ ), due to the additional resonance conjugation (S82.2).

## Scheme 81 Stable and Unstable Hydrosulfamines

Alliger, 1949

Bohme, 1952

Raasch, 1972

Scheme 82 The Mechanism for Decomposition S-Aroylhydrosulfamines

Much of the work presented in Scheme 81 and 82 is speculative. Our work may
serve to clarify some of these notions. The side product $\mathbf{S 7 9 . 1}$ is very closely related to the putatively unstable $N$-alkyl- $S$-aroylhydrosulfamines, but it was isolated without decomposition. Control reactions done on $\mathbf{S 7 9 . 1}$ reveal other significant information. Exposure of S79.1 to the metal and base gave no amide, while treatment with the thiobenzoic acid furnished quantitatively the amide product in five minutes. Sulfur formation was also observed as reported. Moreover, the rapid formation of the same amide and sulfur was detected on treatment with thioacetic acid. In addition, the $\mathbf{S 7 9 . 1}$ was unexpectedly found to be stable to the triflouroacetic acid, in contrast to the thioacid derivatives.

## Scheme 83 Control Reactions on Side Product S79.1

The cyclic intermediate (S82.1) was proposed by Raasch. However, performing a crossover experiment between two stable S-aroylhydrosulfamines, which decompose at about same rates would distinguish unimolecular and bimolecular process. As indicated in Scheme 84, a unimolecular process could also be speculated for decomposition of similar molecules. Both thiaocid and trifluoroacetic acid could protonate two basic sites on S79.1, which could lead to either $\mathbf{S 8 4 . 1}$ or $\mathbf{S 8 4 . 2}$. In principle, both trifluoroacetic and
thiobenzoic acid could lead to $\mathbf{S 8 4 . 3}$. The opening of $\mathbf{S 8 4 . 4}$ likely would not be facile for trifluoroacetic acid due to the low nucleophilicity of the trifluoroaceate anion. A thiocarboxylate could give $\mathbf{S 8 4 . 4}$, which could give rise to the amide and S84.5. S84.5 decomposes to the observed the dimer (S78.1) and sulfur products. However, this mechanism is unnecessarily complex. Another alternative is that $\mathbf{S 8 4 . 2}$ is attacked by thiobenzoic acid to give S78.1 directly. This species is a very potent acylating agent, as is S84.5. Amines react almost instantaneously with such thioanhydrides. This accounts for very rapid conversion of $\mathbf{S 7 9 . 1}$ to amide (Scheme 83), avoids unlikely events such as $\mathbf{S 8 4 . 1} \rightarrow \mathbf{S 8 4 . 3}$, and most of the speculative notions of Alliger, Bohme and Raasch. Although we did not observe benzyl amine in our reaction, it would be expected to form only in trace quantity before rapidly reacting with $\mathbf{S 7 8 . 1}$ to give the amide product.

Scheme 84 The Proposed Mechanism of Amide Formation from S79.1

Although iron (III) chemistry is complex, and ascertaining the precise mechanism of amidation is beyond the scope of these studies, several observations are noteworthy. The iron (III) chloride and DMAP combination could have a substantial effect on the formation of $\mathbf{S 7 9 . 1}$, since all the metals in Table 3 and all bases in Table 6, except for entry 4, failed to couple. The promoter and base could give rise to complex structures

S85.1 and S85.2. An iron complex could coordinate to the internal or to the terminal azide nitrogen and form, for example, S85.3, either of which could facilitate attack of thiobenzoate. Sulfur-nitrogen bond formation could take place simultaneously with loss of nitrogen, which would lead to formation of the S79.1.

Scheme 85 The Mechanism for the Formation of S79.1

We were also curious about side products $\mathbf{S 7 9 . 2}$ and $\mathbf{S 7 9 . 3}$ since they diminish as formation of the major amide product increases. Based on their structure, it is reasonable to speculate that they are formed from a different pathway than S79.1, which could likely involve the highly reactive intermediate S86.3 (Scheme 86). Nucleophiles readily add to the similar electrophiles. ${ }^{8}$ In this case the nucleophiles are the $\mathbf{S 7 9 . 1}$ and the thiobenzoate anion. A plausible mechanism for formation of $\mathbf{S 8 6 . 3}$ is by rearrangement of the azide. The same type of intermediate as $\mathbf{S 8 6 . 2}$ was also invoked by the Kerr group earlier. ${ }^{9}$ Nucleophilic addition of S79.1 to or thiobenzoic acid S86.3 would provide $\mathbf{S 7 9 . 2}$ and S79.3.

## Scheme 86 The Formation of the Intermediate S86.3

In contrast to the reported instability, the metal promoted amidation revealed a stable intermediate (S79.1 and S79.2). Although amide product formation was unambiguously established from S79.1 upon treatment with thiobenzoic acid, it has not been established as the major path by which the amide product is formed. Indeed, it is speculative to indicate that similar mechanism could take place for the thioacid-azide coupling, as opposed to the reported mechanisms. ${ }^{1}$ Nevertheless, this mechanism could be considered as an alternative pathway for amide formation.

## EXPERIMENTAL

General: Starting materials, reagents and solvents were purchased from commercial suppliers (Aldrich, Fischer, Advanced ChemTech) and used without further purification unless otherwise stated. All reactions were conducted in oven-dried ( $135{ }^{\circ} \mathrm{C}$ ) glassware under an inert atmosphere of argon. The progress of reactions was monitored by silica gel thin layer chromatography (tlc) plates (mesh size $60 \AA$ with fluorescent indicator, SigmaAldrich), visualized under UV and charred using cerium or anisaldehyde stain. Products were purified by flash column chromatography (FCC) on $120-400$ mesh silica gel (Fisher). Infrared (FTIR) spectra were recorded on an ATI Mattson Genesis Series FTInfrared spectrophotometer. Proton nuclear magnetic resonance spectra ( ${ }^{1} \mathrm{H}$ NMR $)$ were recorded on either a Varian-300 instrument ( 300 MHz ) or a Varian-400 instrument (400 MHz ) unless otherwise stated. Chemical shifts are reported in ppm relative to residual $\mathrm{CHCl}_{3}$ signal. Data is reported as follows: chemical shift, integration, multiplicity ( $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=\mathrm{quartet}, \mathrm{br}=$ broad, $\mathrm{m}=$ multiplet), and coupling constants ( Hz ). Carbon nuclear magnetic resonance spectra ( ${ }^{13} \mathrm{C}$ NMR) were recorded on either a Varian-300 instrument ( 75 MHz ) or a Varian-400 instrument ( 100 MHz ) unless otherwise stated. Optical rotations were recorded at $25{ }^{\circ} \mathrm{C}$ using the sodium D line (589 nm), on a Perkin-Elmer 241 polarimeter. Mass spectra were recorded on a Finnigan LCQ-DUO mass spectrometer.

## CHAPTER 1

To a solution of methallylmagnesium chloride in THF ( 0.0375 mole, 0.8 M ) at $-78{ }^{\circ} \mathrm{C}$ was added slowly a solution of protected glyceraldeyhde S1.1 (0.025 mole, 3.25 g ) in THF ( 62.5 ml ) down the inside of the flask. The reaction mixture was allowed to warm to room temperature, and stirred for additional 4 h . The mixture was then cooled to $-78{ }^{\circ} \mathrm{C}$, quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution, extracted with $\mathrm{Et}_{2} \mathrm{O}$, and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. Solvent was evaporated and the residue was purified by FCC using hexane:acetone (15:1) as eluent to give $\mathbf{5}$ and $\mathbf{6}$ as a colorless oil ( $3.4 \mathrm{~g}, 74 \%$ ). The ratio anti:syn alcohol was 4:3, as determined by ${ }^{1} \mathrm{H}-\mathrm{NMR}$. $\mathrm{R}_{\mathrm{F}} 0.22$ (15:1-hexane:acetone); IR $v_{\max }$ (neat)/ $/ \mathrm{cm}^{-1} 3475$, 3057, 2986, 1648, 1067; $\delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$ ) 4.86-4.85 ( $2 \mathrm{H}, \mathrm{brs}$ ), 4.79-4.78 (2H, brs), 4.04-3.65 ( $8 \mathrm{H}, \mathrm{m}$ ), 2.29-2.05 ( $6 \mathrm{H}, \mathrm{m}$ ), $1.75(6 \mathrm{H}, \mathrm{brs}) 1.42-1.40(6 \mathrm{H}, \mathrm{s}), 1.35-1.34(6 \mathrm{H}, \mathrm{s})$; $\delta_{\mathrm{C}}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 141.9(\mathrm{~s}), 141.7(\mathrm{~s}), 113.57(\mathrm{t}), 113.50(\mathrm{t}), 109.3(\mathrm{~s}), 109.0(\mathrm{~s})$, 78.6 (d) , 78.3 (d), $69.8(\mathrm{~d}), 68.8(\mathrm{~d}), 65.9(\mathrm{t}), 65.3(\mathrm{t}), 42.0(\mathrm{q}), 41.7(\mathrm{q}), 26.5$ (two signals, q), 25.27 (q), $25.25(\mathrm{q}), 22.4(\mathrm{t}), 22.3(\mathrm{t}) ; \mathrm{m} / z(\mathrm{ESIMS})$ found: $187(\mathrm{M}+1)^{+}$; calcd: 187.

Anti (S2.1)

Syn (S2.2)

The mixture of $\mathbf{S 1 . 3}$ and $\mathbf{S 1 . 4}(1.25 \mathrm{~g}, 6.7 \mathrm{mmol})$ was dissolved in THF ( 12 ml ), and cooled to $0^{\circ} \mathrm{C}$. $\mathrm{NaH}(484 \mathrm{mg}, 12.1 \mathrm{mmol}, 60 \%$ dispersion in mineral oil) was added and the mixture was stirred for 15 min . To this $\mathrm{CH}_{3} \mathrm{I}(1.90 \mathrm{~g}, 0.84 \mathrm{ml}, 13.4 \mathrm{mmol})$ was added and the mixture was allowed to warm to room temperature and stirred over 12 h . The reaction mixture was quenched with sat. $\mathrm{NH}_{4} \mathrm{Cl}$, extracted with $\mathrm{Et}_{2} \mathrm{O}$ and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After removing the solvent in vacuo, the residue was purified by FCC using with hexane:acetone (70:1) as eluent to give $657 \mathrm{mg}(49 \%)$ anti isomer $\mathbf{S 2 . 1}$ and 523 mg (39\%) syn isomer S2.2 as colorless oils (total yield 93\%). Anti isomer S2.1; $\mathrm{R}_{\mathrm{F}} 0.44$ (40:1-hexane:acetone); $[\alpha]^{22}{ }_{\mathrm{D}}+19.0$ (c 4.52, $\mathrm{CHCl}_{3}$ ); IR $v_{\max }($ neat $) / \mathrm{cm}^{-1} 3076,2985$, 1647,$1104 ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 4.82-4.79(1 \mathrm{H}, \mathrm{brs}), 4.789-4.786(1 \mathrm{H}$, brs $), 4.08-4.00$ $(2 \mathrm{H}, \mathrm{m}), 3.90-3.87(1 \mathrm{H}, \mathrm{m}), 3.47-3.44(1 \mathrm{H}, \mathrm{m}), 3.44(3 \mathrm{H}, \mathrm{s}), 2.30-2.15(2 \mathrm{H}, \mathrm{m}), 1.79(3 \mathrm{H}$, $\mathrm{s}), 1.42(3 \mathrm{H}, \mathrm{s}), 1.34(3 \mathrm{H}, \mathrm{s}) ; \delta_{\mathrm{C}}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 142.2(\mathrm{~s}), 112.9(\mathrm{t}), 108.9(\mathrm{~s}), 79.7$ (q), $77.4(\mathrm{~d}), 65.7(\mathrm{t}), 58.5(\mathrm{~d}), 39.3(\mathrm{q}), 26.3(\mathrm{q}), 25.2(\mathrm{q}), 22.7(\mathrm{t}) ; \mathrm{m} / \mathrm{z}$ (ESIMS) found: $201(\mathrm{M}+1)^{+}$; calcd: 201.

Syn isomer S2.2; $\mathrm{R}_{\mathrm{F}} 0.27$ (40:1-hexane:acetone); $[\alpha]_{\mathrm{D}}^{22}+9.7$ (c $0.72, \mathrm{CHCl}_{3}$ ); IR $v_{\max }($ neat $) / \mathrm{cm}^{-1} 3076,2985,1647,1107 ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 4.82(1 \mathrm{H}, \mathrm{brs}), 4.78(1 \mathrm{H}$, brs), 4.19-4.14 ( $1 \mathrm{H}, \mathrm{m}$ ), $3.992(1 \mathrm{H}, \mathrm{dd}, \mathrm{J}=6.8,8.4), 3.70-3.66(1 \mathrm{H}, \mathrm{m}), 3.46(3 \mathrm{H}, \mathrm{m})$, $3.41-3.36(1 \mathrm{H}, \mathrm{m}), 2.73(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=5.6), 1.79(3 \mathrm{H}, \mathrm{s}), 1.43(3 \mathrm{H}, \mathrm{s}), 1.36(3 \mathrm{H}, \mathrm{s}) ; \delta_{\mathrm{C}}(100$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) 142.1$ (s), 112.9 (t), 109.1 ( s$), 80.3$ (q), 77.6 (d), 65.7 ( t$), 58.3$ (d), 38.5 (q), 26.4 (q), $25.2(\mathrm{q}), 22.8(\mathrm{t}) ; m / z(\mathrm{ESIMS})$ found: $201(\mathrm{M}+1)^{+} ;$calcd: 201.

The protected diol S2.1 ( $627 \mathrm{mg}, 3.1 \mathrm{mmol}$ ) was stirred in 6.5 ml of $\mathrm{AcOH}: \mathrm{H}_{2} \mathrm{O}$ mixture (4:1) for 20 h at room temperature. The reaction mixture was concentrated and purified by FCC using with hexane:acetone (5:1) as eluent to afford $461 \mathrm{mg}(93 \%)$ diol as a colorless oil. $\mathrm{R}_{\mathrm{F}} 0.10$ (5:1-hexane:acetone); $[\alpha]^{22}{ }_{\mathrm{D}}+22.5$ (c 1.42, $\mathrm{CHCl}_{3}$ ); IR $v_{\max }($ neat $) / \mathrm{cm}^{-1} 3395,3086,2935,1649,1101 ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 4.83(1 \mathrm{H}, \mathrm{brs}), 4.79$ $(1 \mathrm{H}, \mathrm{brs}), 3.57-3.68(3 \mathrm{H}, \mathrm{m}), 3.52-3.48(1 \mathrm{H}, \mathrm{m}), 3.41(3 \mathrm{H}, \mathrm{s}), 3.00(2 \mathrm{H}, \mathrm{brs}), 2.364-2.328$ $(1 \mathrm{H}, \mathrm{m}), 2.203-2.206(1 \mathrm{H}, \mathrm{m}), 1.78(3 \mathrm{H}, \mathrm{s}) ; \delta_{\mathrm{C}}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 142.2(\mathrm{~s}), 113.2(\mathrm{t})$, $81.7(\mathrm{q}), 72.4(\mathrm{~d}), 63.1(\mathrm{t}), 58.3(\mathrm{~d}), 38.7(\mathrm{q}), 22.7(\mathrm{t}) ; \mathrm{m} / \mathrm{z}(\mathrm{ESIMS})$ found: $183(\mathrm{M}+23)^{+}$; calcd: 183.

To a solution of diol ( $205 \mathrm{mg}, 1.28 \mathrm{mmol}$ ) in DMF ( 4 ml ) was added imidazole ( 262 mg , 3.84 mmol ) and TBSCl ( $503 \mathrm{mg}, 3.33 \mathrm{mmol}$ ). The reaction mixture was stirred overnight, and then diluted with $\mathrm{H}_{2} \mathrm{O}$. The solution was extracted with $\mathrm{Et}_{2} \mathrm{O}$, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After removing the solvent in vacuo, the residue was purified by FCC using hexane:acetone (40:1) as eluent to give $437 \mathrm{mg}(88 \%)$ bis-[TBS] ether as a colorless oil. $\mathrm{R}_{\mathrm{F}} 0.93$ (40:1-hexane:acetone); $[\alpha]^{22}{ }_{\mathrm{D}}-8.7$ (c $6.06, \mathrm{CHCl}_{3}$ ); IR $v_{\max }($ neat $) / \mathrm{cm}^{-1} 3076$, 2955, 1650, 1183, 1082; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 4.79(1 \mathrm{H}, \mathrm{brs}), 4.80(1 \mathrm{H}, \mathrm{brs}), 4.77(1 \mathrm{H}$, brs), $3.82-3.77(1 H, m), 3.56(2 H, d, J=5.7 \mathrm{~Hz}), 3.47-3.42(1 H, m), 3.38(3 H, s), 2.25$ $(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=6.9 \mathrm{~Hz}), 1.77(3 \mathrm{H}, \mathrm{s}), 0.90(9 \mathrm{H}, \mathrm{s}), 0.89(9 \mathrm{H}, \mathrm{s}), 0.06(6 \mathrm{H}, \mathrm{s}), 0.07(6 \mathrm{H}, \mathrm{s}) ; \delta_{\mathrm{C}}$ ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 143.6 ( s$), 112.1$ (t), 81.3 (q), 74.5 (d), 64.6 (t), 58.3 (d), 38.7 (q), 26.3

To a solution of bis-[TBS] ether ( $440 \mathrm{mg}, 1.13 \mathrm{mmol}$ ) in THF ( 3.6 ml ) in a plastic vial was added pyridine $(0.60 \mathrm{ml})$ and HF-pyridine $(0.1 \mathrm{ml}$ of a $65-70 \%$ solution of HF in pyridine). The mixture was stirred 22 h , then diluted with $\mathrm{Et}_{2} \mathrm{O}$ and washed with 0.5 M HCl solution. The aqueous layer was re-extracted with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic layers were washed with saturated $\mathrm{CuSO}_{4} \cdot \mathrm{H}_{2} \mathrm{O}$ and dried over $\mathrm{NaSO}_{4}$. After removing the solvent, the residue was purified by FCC using hexane:acetone (20:1) as eluent to give $226 \mathrm{mg}(73 \%)$ mono-alcohol $\mathbf{S} 2.3$ as a colorless oil. $\mathrm{R}_{\mathrm{F}} 0.24$ (20:1-hexane:acetone); $[\alpha]^{22}{ }_{\mathrm{D}}+5.4\left(\mathrm{c} 2.98, \mathrm{CHCl}_{3}\right) ;$ IR $v_{\max }($ neat $) / \mathrm{cm}^{-1} 3456,3076,2930,1649,1112 ; \delta_{\mathrm{H}}(400$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) 4.81(1 \mathrm{H}$, brs $), 4.79(1 \mathrm{H}, \mathrm{brs}) 3.73-3.60(3 \mathrm{H}, \mathrm{m}), 3.43(3 \mathrm{H}, \mathrm{s}), 3.41-3.39$ $(1 \mathrm{H}, \mathrm{m}), 2.29-2.15(3 \mathrm{H}, \mathrm{m}), 0.9(9 \mathrm{H}, \mathrm{s}), 0.09(6 \mathrm{H}, \mathrm{s}) ; \delta_{\mathrm{C}}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 142.9(\mathrm{~s})$, $112.9(\mathrm{t}), 82.1(\mathrm{q}), 74.5(\mathrm{~d}), 64.1(\mathrm{t}), 59.3(\mathrm{~d}), 40.4(\mathrm{q}), 26.1(\mathrm{q}), 23.1(\mathrm{t}), 18.4(\mathrm{~s}),-4.0(\mathrm{q})$, -4.1 (q); $m / z$ (ESIMS) found: $275(\mathrm{M}+1)^{+}$; calcd: 275.

A solution of oxalyl chloride $(0.19 \mathrm{ml}, 2.18 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(7 \mathrm{ml})$ was cooled down to $-78^{\circ} \mathrm{C}$. DMSO $(0.340 \mathrm{ml}, 4.79 \mathrm{mmol})$ was syringed in one portion and stirred for 15 min . Then the alcohol S2.3 (396 mg, 1.45 mmol ) dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(7 \mathrm{ml})$ was added slowly. After $30 \mathrm{~min} \mathrm{Et}_{3} \mathrm{~N}(1,026 \mathrm{ml}, 7.4 \mathrm{mmol})$ was added after which the cooling bath was replaced by an ice bath. Stirring was continued for 20 min , and then diluted with
$\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and $\mathrm{H}_{2} \mathrm{O}$. Extraction with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and drying over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ furnished 386 mg (98\%) aldehyde. $[\alpha]^{22}{ }_{\mathrm{D}}-27.6\left(\mathrm{c} 0.98, \mathrm{CHCl}_{3}\right)$; IR $v_{\max }($ neat $) / \mathrm{cm}^{-1} 3069,2955,2858,1733$, 1647,$1109 ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 9.59(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=1.1 \mathrm{~Hz}) 4.82(2 \mathrm{H}, \mathrm{brs}), 4.13(1 \mathrm{H}, \mathrm{dd}$, $\mathrm{J}=2.4,1.1 \mathrm{~Hz}), 3.60(1 \mathrm{H}, \mathrm{dt}, \mathrm{J}=7.0,2.4 \mathrm{~Hz}), 3.61(3 \mathrm{H}, \mathrm{s}), 2.33-2.21(2 \mathrm{H}, \mathrm{m}), 0.93(9 \mathrm{H}, \mathrm{s})$, $0.08(6 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.2 \mathrm{~Hz}) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 203.4(\mathrm{~s}), 141.4(\mathrm{~s}), 114.8(\mathrm{t}), 83.0(\mathrm{q}), 78.7$ (d), 58.1 (d), 38.8 (q), $26.0(\mathrm{q}), 22.9(\mathrm{t}), 18.5(\mathrm{~s}),-4.4(\mathrm{q}),-4.5(\mathrm{q}) ; m / z$ (ESIMS) found: $273(\mathrm{M}+1)^{+}$; calcd: 273.

A solution of aldehyde ( $150 \mathrm{mg}, 0.55 \mathrm{mmol}$ ) in $12.5 \mathrm{ml} \mathrm{tBuOH}-\mathrm{H}_{2} \mathrm{O}$ (3.5:1) was cooled to $0{ }^{\circ} \mathrm{C}$, to which was added $\mathrm{NaH}_{2} \mathrm{PO}_{4} \cdot \mathrm{H}_{2} \mathrm{O}(137 \mathrm{mg}, 0.99 \mathrm{mmol})$, 2-methyl-2-butene ( 10 $\mathrm{mmol}, 5.2 \mathrm{ml}$ from 2 M solution in THF) and $\mathrm{NaClO}_{2}(122 \mathrm{mg}, 1.35 \mathrm{mmol})$. The cooling bath was removed after 5 min and stirring was continued for 2 h . The mixture was concentrated, diluted with $\mathrm{H}_{2} \mathrm{O}$, acidified with 1 N HCl until $\mathrm{pH} 2-3$ was reached, and then extracted with $\mathrm{Et}_{2} \mathrm{O}(5 \times)$. The organic extract was washed with brine and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After removing the solvent in vacuo, the residue was purified by FCC $(50 \%$ hexane:acetone and $1 \% \mathrm{AcOH}$ ) to furnish 80 mg ( $84 \%$ ) carboxylic acid $\mathbf{S 2 . 4}$ as a colorless oil. $\mathrm{R}_{\mathrm{F}} 0.34$ (1:1:0.01-hexane:acetone:acetic acid); $[\alpha]^{22}{ }_{\mathrm{D}}+18.6$ (c $0.86, \mathrm{CHCl}_{3}$ ); IR $v_{\max }($ neat $) / \mathrm{cm}^{-1} 3600-2500,3395,3077,2936,1732,1651,1105 ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ $4.87(1 \mathrm{H}, \mathrm{brs}), 4.84(1 \mathrm{H}, \mathrm{brs}), 4.40(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=3.9 \mathrm{~Hz}), 3.76-3.71(1 \mathrm{H}, \mathrm{m}), 3.48(3 \mathrm{H}, \mathrm{s})$, 2.46-2.29 (2H, m), $1.79(3 \mathrm{H}, \mathrm{s}) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 175.1(\mathrm{~s}), 141.4(\mathrm{~s}), 114.0(\mathrm{t}), 81.4$ (q), 71.3 (d), $58.3(\mathrm{~d}), 37.8(\mathrm{q}), 23.0(\mathrm{t}) ; m / z(\mathrm{ESIMS})$ found: $197(\mathrm{M}+23)^{+} ;$calcd: 197.

To a solution of 2-hydroxy-carboxylic acid $\mathbf{S} \mathbf{2} .4$ ( $43.5 \mathrm{mg}, 0.25 \mathrm{mmol}$ ), catalytic amount of DMAP $(\sim 1 \mathrm{mg})$, and pyridine ( $43 \mu \mathrm{l}, 0.53 \mathrm{mmol}$ ) was added $\mathrm{TMSCl}(68 \mu \mathrm{l}, 0.53$ mmol ) dropwise. The reaction was stirred at room temperature for 3 h . The reaction was cooled to $0{ }^{\circ} \mathrm{C}$ and catalytic DMF ( 1 drop) was added followed by oxalyl chloride ( $25 \mu$ l, $0.28 \mathrm{mmol})$. The reaction mixture was stirred for 30 min at $0^{\circ} \mathrm{C}$ and then 30 min at room temperature. After cooling the mixture to $0{ }^{\circ} \mathrm{C}$, a solution of isopropyl amine ( $43 \mu \mathrm{l}, 0.5$ $\mathrm{mmol})$ in pyridine $(121 \mu \mathrm{l}, 1.5 \mathrm{mmol})$ was added and the reaction was allowed to warm to room temperature and stir for 2 h . Citric acid ( $111.3 \mathrm{mg}, 0.53 \mathrm{mmol}$ ) was dissolved in methanol ( 1 ml ) and added to the reaction. After 45 min , the mixture was poured into o separatory funnel and diluted with ethyl acetate. The organic phase was washed with 1 N HCl and the aqueous wash was back extracted with ethyl acetate. The combined organic layers were washed with a saturated bicarbonate solution followed by brine and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After removing the solvent, the residue was purified by FCC using hexane:acetone (5:1) as eluent to furnish $27 \mathrm{mg}(50 \%)$ amide $\mathbf{S 2} .5$ as a white solid. For crystallization, 1 mg of purified compound $\mathbf{S} \mathbf{2 . 5}$ was dissolved in 1 ml of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, and then almost 1 ml of hexane was added until turbidity appeared. Colorless crystals were obtained in next day. $\mathrm{R}_{\mathrm{F}} 0.36$ (5:1-hexane:acetone); $[\alpha]^{22}{ }_{\mathrm{D}}-24.2$ (c $0.99, \mathrm{CHCl}_{3}$ ); IR (KBr) 3391, 3285, 3077, 2974, 1650, 1648, 1104; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}\right) 4.76(1 \mathrm{H}, \mathrm{s})$, $4.73(1 \mathrm{H}, \mathrm{s}), 4.26(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=3 \mathrm{~Hz}), 4.00(1 \mathrm{H}, \mathrm{m}, \mathrm{J}=6.6 \mathrm{~Hz}), 3.66(1 \mathrm{H}, \mathrm{dt}, \mathrm{J}=9.3,3.0), 3.38$ $(3 \mathrm{H}, \mathrm{s}), 2.27(1 \mathrm{H}, \mathrm{ddd}, \mathrm{J}=14,9.3,0.6), 2.05(1 \mathrm{H}, \mathrm{dd}, \mathrm{J}=14,3.6), 1.73(3 \mathrm{H}, \mathrm{s}), 1.56(6 \mathrm{H}$, dd, J=6.6, 4.5 Hz ); ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 172.3 (s), 142.6 (s), 111.7 (t), 81.4 (q), 71.2 (d),

## CHAPTER 3

To a solution of $\mathrm{K}_{2} \mathrm{CO}_{3}(24.8 \mathrm{~g}, 180 \mathrm{mmol}), \mathrm{TsN}_{3}(15.3 \mathrm{~g}, 78 \mathrm{mmol})$ in 400 mL was syringed dimethyl-(2-oxapropyl) phosphonate ( $10.6 \mathrm{~mL}, 78 \mathrm{mmol}$ ) at rt . After stirring for 2 h , a solution of aldehyde $\mathbf{S 3 5 . 2}(13.3 \mathrm{~g}, 60 \mathrm{mmol})$ in 80 mL of MeOH was added. Stirring continued for 20 h , the mixture was concentrated under reduced pressure and then diluted with distilled water. The mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}$ and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. Purification by FCC using ethyl acetate / hexane (1:20) afforded $11.4 \mathrm{~g}(85 \%)$ alkyne S35.1 as a colorless oil. IR $v_{\max }$ (neat) $/ \mathrm{cm}^{-1} 3290$, 2970, 2934, 2100, 1612, 1586, $1513 ;{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $7.28(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.4 \mathrm{~Hz}), 6.88(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.4 \mathrm{~Hz}), 4.54$ $(2 \mathrm{H}, \mathrm{s}), 3.80(3 \mathrm{H}, \mathrm{s}), 3.29(2 \mathrm{H}, \mathrm{s}), 2.12(1 \mathrm{H}, \mathrm{s}), 1.23(3 \mathrm{H}, \mathrm{s}),{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $161.8,159.1,130.5,129.1,113.7,90.3,73.0,68.1,55.2,32.2,26.0 . m / z$ (ESIMS) calculated for $\mathrm{C}_{14} \mathrm{H}_{18} \mathrm{O}_{2} \mathrm{Na}[\mathrm{MNa}]^{+}$241.12, found: 241.1.

To a solution of alkyne $\mathbf{S 3 5 . 1}$ ( $200 \mathrm{mg}, 0.9 \mathrm{mmol}$ ) in THF was added $0.4 \mathrm{~mL} \mathrm{n}-\mathrm{BuLi}$ $(2.5 \mathrm{M})$ at $-78^{\circ} \mathrm{C}$. After warming to $0^{\circ} \mathrm{C}$ and stirring for 30 min , the reaction mixture was cooled to $-78{ }^{\circ} \mathrm{C}$ and a solution of weinreb amide S35.5 in THF was added slowly.

Stirring continued for 2 h at $-20{ }^{\circ} \mathrm{C}$ and the mixture was quenched with $\mathrm{NH}_{4} \mathrm{Cl}$ solution.
The mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organic extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure. The residue was purified by FCC (silica gel, ethyl acetate/hexane 1:10) to give 400 mg product $\mathbf{S 3 5 . 6}$ (85\%) as a colorless oil. IR $v_{\max }$ (neat) $/ \mathrm{cm}^{-1} 3068,2950,2925,2200,1696,1673,1612,1513,1427,1110,702$;
${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ 7.70-7.67 $(4 \mathrm{H}, \mathrm{m}), 7.44-7.35(6 \mathrm{H}, \mathrm{m}), 7.23(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=5.4$ $\mathrm{Hz}), 6.85(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=5.4 \mathrm{~Hz}), 4.48(2 \mathrm{H}, \mathrm{s}), 4.29(2 \mathrm{H}, \mathrm{s}), 3.80(3 \mathrm{H}, \mathrm{s}), 3.3(2 \mathrm{H}, \mathrm{s}), 1.25$ $(6 \mathrm{H}, \mathrm{s}), 1.09(9 \mathrm{H}, \mathrm{s}) ; \mathrm{m} / \mathrm{z}$ (ESIMS) calculated for $\mathrm{C}_{32} \mathrm{H}_{38} \mathrm{O}_{4} \mathrm{SiNa}[\mathrm{MNa}]^{+} 537.24$, found: 537.3.

To a solution of Noyori catalyst in 3 mL iPrOH was added a solution of ketone $\mathbf{S 3 5 . 6}$ ( $372 \mathrm{mg}, 1.00 \mathrm{mmol}$ ) in 3 mL iPrOH . The mixture was stirred for 30 min , then was concentrated in vacuo. Purification of the residue by FCC using hexane/ethyl acetate (1:10) furnished $362 \mathrm{mg}(97 \%)$ alcohol $\mathbf{S 3 6 . 1}$ as a colorless oil. $[\alpha]^{25}{ }_{\mathrm{D}}=-9.6(\mathrm{c}=0.83$, $\mathrm{CHCl}_{3}$ ); IR $v_{\max }($ neat $) / \mathrm{cm}^{-1} 3448,3070,2955,2930,2238,1612,1513,1427,1247,1112$, 702; ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.71-7.65(4 \mathrm{H}, \mathrm{m}), 7.45-7.35(6 \mathrm{H}, \mathrm{m}), 7.24(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=$ $5.4 \mathrm{~Hz}), 6.84(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=5.4 \mathrm{~Hz}), 4.49-4.45(3 \mathrm{H}, \mathrm{m}), 3.80-3.66(4 \mathrm{H}, \mathrm{m}), 1.20(6 \mathrm{H}, \mathrm{s}), 1.06$ (9H, s); m/z (ESIMS) calculated for $\mathrm{C}_{32} \mathrm{H}_{40} \mathrm{O}_{4} \mathrm{SiNa}[\mathrm{MNa}]^{+}$539.26, found: 539.4..

A solution of $\mathrm{PPh}_{3}(249 \mathrm{mg}, 0.95 \mathrm{mmol})$ in 2 mL THF was cooled to $-15{ }^{\circ} \mathrm{C}$ and was added DIAD (192 mg, 0.95 mmol ). The mixture was stirred for 10 min then a solution of alcohol S36.1 ( $300 \mathrm{mg}, 0.63 \mathrm{mmol}$ ) in 2 mL THF was added. After 10 min , NBSH (206 $\mathrm{mg}, 0.95 \mathrm{mmol}$ ) in 1 mL THF was added at $-15^{\circ} \mathrm{C}$. Stirring continued after warming to rt for 12 h . The solvent was removed under vacuum and the crude was directly purified by FCC (silica gel, hexane/ethyl acetate $1: 15$ ) to afford allene $\mathbf{S 3 6 . 2}$ ( $201 \mathrm{mg}, 61 \%$ ) as a colorless oil. $[\alpha]^{25}{ }_{D}=-35.7\left(\mathrm{c}=1.82, \mathrm{CHCl}_{3}\right)$; IR $v_{\max }($ neat $) / \mathrm{cm}^{-1} 3070,2958,2930,1962$, $1612,1513,1112,702 ;{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 7.73-7.67 (4H, m), 7.42-7.26 (6H, m), $7.23(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=5.7 \mathrm{~Hz}), 6.86(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=5.7 \mathrm{~Hz}), 5.35-5.22(2 \mathrm{H}, \mathrm{m}), 4.43(2 \mathrm{H}, \mathrm{s}), 4.20$ $(2 \mathrm{H}, \mathrm{dd}, \mathrm{J}=2.7,6.0), 3.80(3 \mathrm{H}, \mathrm{s}), 3.15(2 \mathrm{H}, \mathrm{s}) 1.04(9 \mathrm{H}, \mathrm{s}), 1.02(3 \mathrm{H}, \mathrm{s}), 1.01(3 \mathrm{H}, \mathrm{s}) ;$ $m / z$ (ESIMS) calculated for $\mathrm{C}_{32} \mathrm{H}_{40} \mathrm{O}_{3} \mathrm{SiNa}[\mathrm{MNa}]^{+}$523.26, found: 523.3.

To a solution of allene $\mathbf{S 3 6 . 2}$ ( $6.25 \mathrm{~g}, 12.4$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(80 \mathrm{~mL})$ was added buffer ( 8 mL , $\mathrm{pH}=7.40)$ and cooled to $0{ }^{\circ} \mathrm{C}$. DDQ was added to the mixture and stirred for 30 min . The reaction mixture was quenched with $\mathrm{NaHCO}_{3}$, diluted with $\mathrm{H}_{2} \mathrm{O}$, extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. Solvent was evaporated and the residue was treated with excess amount of $\mathrm{NaBH}_{4}$ in MeOH to remove the resulting anisaldeyhde. The mixture was
quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution, extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and purified by FCC using hexane/ethyl acetate (20:1) as eluent to furnish alcohol S36.3 (4.65 g, 98\%) as a colorless oil. IR $v_{\max }($ neat $) / \mathrm{cm}^{-1} 3419,3071,2959,2930,2858,1962,1471,1427,1112$, 702; ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 7.70-7.68 (4H, m), 7.45-7.36 (6H, m), 5.36-5.31 ( 1 H , m), 5.17-5.14 ( $1 \mathrm{H}, \mathrm{m}$ ), 4.20-4.17 $(2 \mathrm{H}, \mathrm{m}), 3.42(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=10.8 \mathrm{~Hz}), 3.31(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=10.8$ $\mathrm{Hz}), 1.05(9 \mathrm{H}, \mathrm{s}), 1.01(6 \mathrm{H}, \mathrm{s}) ;{ }^{13} \mathrm{C}$ NMR (100 MHz) 201.9, 135.7, 133.6, 129.9, 127.9, $100.9, ~ 93.7,71.5,62.0,37.7,26.9,25.1,24.9,19.4 ; \mathrm{m} / \mathrm{z}$ (ESIMS) calculated for $\mathrm{C}_{24} \mathrm{H}_{32} \mathrm{O}_{3} 2 \mathrm{iNa}[\mathrm{MNa}]^{+} 403.2$, found: 403.3.

A solution of alcohol $\mathbf{S 3 6 . 3}(6.4 \mathrm{~g}, 16.8 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(100 \mathrm{~mL})$ was treated with Dess-Martin periodinone at room temperature, After stirring for 2 h , the mixture was quenched with a $2: 1(\mathrm{v} / \mathrm{v})$ mixture of saturated $\mathrm{NaHCO}_{3}$ and saturated $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organic extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and solvent was removed in vacuo. Purification by FCC using hexane/ethyl acetate as eluent furnished aldehyde $\mathbf{S 3 7 . 1}$ (5.4 g, 85\%) as a colorless oil.

S37.1

To the solution of aldehyde $\mathbf{S 3 7 . 1}$ ( $5.2 \mathrm{~g}, 13.7 \mathrm{mmol}$ ) in THF ( 80 mL ) at $-78{ }^{\circ} \mathrm{C}$ was
added the ethynyl magnesium bromide solution slowly. After stirring for 5 min , the reaction mixture was placed in refrigerator for 12 h . The mixture was quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ at cold temperature, extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and then dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The crude alcohol was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(100 \mathrm{~mL})$ and treated with Dess-Martin periodinone $(8.2 \mathrm{~g}, 19.3 \mathrm{mmol})$ at room temperature. The mixture was stirred for 30 min and then quenched with a $2: 1(\mathrm{v} / \mathrm{v})$ mixture of saturated $\mathrm{NaHCO}_{3}$ and saturated $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$. The aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. Evaporation of the solvent and then purification by FCC using hexane/ethyl aceate (20:1) as eluent afforded ketone $\mathbf{S 3 7 . 2}$ ( $4.9 \mathrm{~g}, 89 \%$ over two steps) as a colorless oil. IR $v_{\max }($ neat $) / \mathrm{cm}^{-1} 3269$, 3071, 2961, 2931, 2091, 1964, 1680, 1464, 1427, 1112, $702 ;{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 7.68-7.66 (4H, m), 7.42-7.35 (6H, m), 5.48-5.43 (1H, m), 5.35-5.32 (1H, m), 4.24-4.22 $(2 \mathrm{H}, \mathrm{m}), 3.13(1 \mathrm{H}, \mathrm{s}), 1.27(6 \mathrm{H}, \mathrm{s}), 1.04(9 \mathrm{H}, \mathrm{s}) ;{ }^{13} \mathrm{C}$ NMR (100 MHz) 203.3, 190.3, 135.7, 133.7, 129.9, 127.9, 97.6, 95.2, 80.8, 79.8, 61.9, 48.5, 27.0, 24.1, 23.8, 19.4; m/z (ESIMS) calculated for $\mathrm{C}_{26} \mathrm{H}_{30} \mathrm{O}_{2} \mathrm{SiNa}[\mathrm{MNa}]^{+}$425.19, found: 425.2.

S37.2

S37.3

A solution of S-(CBS) $(2.6 \mathrm{~g}, 9.32 \mathrm{mmol})$ in THF $(40 \mathrm{~mL})$ at $-30^{\circ} \mathrm{C}$ was treated with $\mathrm{BH}_{3} \cdot \mathrm{SMe}_{2}$ ( $4.66 \mathrm{~mL}, 9.32 \mathrm{mmol}$ ). After stirring for 15 min , a solution of allene $\mathbf{S 3 7 . 2}$ $(3.57 \mathrm{~g}, 8.80 \mathrm{mmol})$ in THF was added over the course of 10 min . The reaction mixture was stirred for 1 h and quenched with MeOH . The mixture was concentrated down and purified by FCC using hexane/ethyl acetate (1:30) as eluent to furnish alcohol S37.3
$(3.20 \mathrm{~g}, 90 \%$, dr: $10 ; 1)$ as a colorless oil. $[\alpha]^{25}=-83.5\left(\mathrm{c}=1.70, \mathrm{CHCl}_{3}\right) ;$ IR $v_{\max }($ neat $) / \mathrm{cm}^{-1} 3303,3071,2961,2930,1953,1472,1427,1112,701 ;{ }^{1} \mathrm{H}$ NMR (400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.69(\mathrm{~m}, 4 \mathrm{H}), 7.40(\mathrm{~m}, 6 \mathrm{H}), 5.38(\mathrm{dd}, 1 \mathrm{H}, \mathrm{J}=6.0,12.0 \mathrm{~Hz}), 5.27(\mathrm{~m}, 1 \mathrm{H})$, $4.21(\mathrm{~m}, 2 \mathrm{H}), 4.06(\mathrm{dd}, 1 \mathrm{H}, \mathrm{J}=2.4,6.4 \mathrm{~Hz}), 2.41(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=2.0 \mathrm{~Hz}), 2.16(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=6.8$ $\mathrm{Hz}), 1.11(\mathrm{~s}, 3 \mathrm{H}), 1.11(\mathrm{~s}, 3 \mathrm{H}), 1.05(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{1} \mathrm{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ 202.8, 135.6, $133.6,133.5,129.7,127.7,98.9,93.9,74.1,70.2,62.1,40.3,26.8,24.1,23.3,19.2 ; \mathrm{m} / \mathrm{z}$ (ESIMS) calculated for $\mathrm{C}_{26} \mathrm{H}_{32} \mathrm{O}_{2} \mathrm{SiNa}[\mathrm{MNa}]^{+} 427.21$, found: 427.2.

To a solution of allene $\mathbf{S 3 7 . 3}$ ( $3.0 \mathrm{~g}, 7.42 \mathrm{mmol}$ ) in $\mathrm{CHCl}_{3}(100 \mathrm{~mL})$ was added DMDO in $\mathrm{CHCl}_{3}(115 \mathrm{~mL}, 22 \mathrm{mmol})$ slowly at $0{ }^{\circ} \mathrm{C}$. The mixture was stirred for 40 min at $0^{\circ} \mathrm{C}$, followed by addition of MeOH . After stirring for 12 h at room temperature the mixture was concentrated down in vacuo. Purification by FCC using hexane/ethyl acetate (25:1) as eluent provided ketone $\mathbf{S 3 8 . 3}$ ( $2.27 \mathrm{~g}, 70 \%$ ) as a colorless oil. The ratio was 8:1, as determined by NMR. $[\alpha]^{25}{ }_{\mathrm{D}}=+6.76\left(\mathrm{c}=1.05, \mathrm{CHCl}_{3}\right) ;$ IR $v_{\max }($ neat $) / \mathrm{cm}^{-1} 3500,3285$, 3071, 2962, 2931, 1732, 1471, 1428, 1113, 701; ${ }^{1} \mathrm{H}$ NMR (400 MHz, $\mathrm{CDCl}_{3}$ ) 7.70-7.56 $(4 \mathrm{H}, \mathrm{m}), 7.48-7.36(6 \mathrm{H}, \mathrm{m}), 5.16(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=2.4 \mathrm{~Hz}), 4.26(2 \mathrm{H}, \mathrm{s}), 4.05(1 \mathrm{H}, \mathrm{dd}, \mathrm{J}=11.6$, $3.6 \mathrm{~Hz}), 3.90(1 \mathrm{H}, \mathrm{dd}, \mathrm{J}=11.6,3.6 \mathrm{~Hz}), 3.5(1 \mathrm{H}, \mathrm{brs}), 2.57(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=2.4 \mathrm{~Hz}), 1.05(9 \mathrm{H}$, s), $1.04(3 \mathrm{H}, \mathrm{s}), 1.01(3 \mathrm{H}, \mathrm{s}) ;{ }^{13} \mathrm{C}$ NMR ( 100 MHz ) 208.6, 161.9, 135.7, 135.6, 135.0, $132.0,130.1,129.6,128.0,127.7,81.5,81.1,79.1,75.2,73.1,66.0,44.4,26.8,26.6,23.2$, 19.1, 14.9; m/z (ESIMS) calculated for $\mathrm{C}_{26} \mathrm{H}_{34} \mathrm{O}_{4} \mathrm{SiNa}[\mathrm{MNa}]^{+} 459.20$, found: 459.2.

To a solution of ketone $\mathbf{S 3 8 . 3}(2.03 \mathrm{~g}, 4.6 \mathrm{mmol})$ and $\mathrm{Me}_{4} \mathrm{NBH}(\mathrm{OAc})_{3}(6.12 \mathrm{~g}, 23.3$ $\mathrm{mmol})$, in $\mathrm{CH}_{3} \mathrm{CN}(40 \mathrm{~mL})$ at $-40^{\circ} \mathrm{C}$ was added acetic acid $(10.0 \mathrm{~mL})$. After 5 min , the reaction mixture was warmed to $-20^{\circ} \mathrm{C}$ and kept at $-20^{\circ} \mathrm{C}$ for 48 h . The mixture was quenched with saturated $\mathrm{NaHCO}_{3}$ at cold temperature, extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. Solvent was removed in vacuo and then the crude was purified by FCC using hexane/ethyl acetate (1:2) as eluent to give diol S42.1 (1.50 g, $74 \%$ ) as a white foam. $[\alpha]^{25}{ }_{\mathrm{D}}=+25.0\left(\mathrm{c}=1.00, \mathrm{CHCl}_{3}\right)$; IR $v_{\max }($ neat $) / \mathrm{cm}^{-1} 3436,3304,3071,2960,2931$, 1723, 1471, 1427, 1113, 702; ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 7.72-7.69 (4H, m), 7.44-7.39 $(6 \mathrm{H}, \mathrm{m}), 4.30(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=2.4 \mathrm{~Hz}), 4.2(1 \mathrm{H}, \mathrm{q}, \mathrm{J}=5.2 \mathrm{~Hz}), 4.07(1 \mathrm{H}, \mathrm{dd}, \mathrm{J}=11.2,4.8 \mathrm{~Hz})$, 4.00-3.92 $(2 \mathrm{H}, \mathrm{m}), 3.55(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=8 \mathrm{~Hz}), 2.48(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=2.4 \mathrm{~Hz}), 1.10(6 \mathrm{H}, \mathrm{s}), 1.07(9 \mathrm{H}$, $\mathrm{s}) ;{ }^{13} \mathrm{C}$ NMR (75 MHz) 135.8, 132.6, 130.1, 128.0, 80.5, 76.7, 75.2, 73.7, 71.4, 70.7, 63.2, 56.8, 39.9, 27.2, 24.3, 19.5; m/z (ESIMS) calculated for $\mathrm{C}_{32} \mathrm{H}_{40} \mathrm{O}_{3} \mathrm{SiNa}[\mathrm{MNa}]^{+}$ 461.21, found: 461.3.

S42.1

S42.2

To a solution of diol $\mathbf{S 4 2 . 1}$ ( $94 \mathrm{mg}, 0.215 \mathrm{mmol}$ ) in 5.0 mL THF (containing trace water) at $0{ }^{\circ} \mathrm{C}$ was added NaH ( $60 \%$ of suspension in mineral oil, $45 \mathrm{mg}, 1.125 \mathrm{mmol}$ ). After stirring for $5 \mathrm{~min}, \mathrm{MOMCl}(52 \mathrm{mg}, 0.65 \mathrm{mmol})$ was added dropwise. The reaction flask was kept in an ice bath for 10 min and then the ice bath was removed. After stirring for another 30 min , the reaction was quenched with $\mathrm{NH}_{4} \mathrm{Cl}$ solution and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organic extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure. The residue was purified by FCC (silica gel, ethyl acetate/hexane 1:4) to give 62 mg compound $\mathbf{S 4 2 . 2}(60 \%)$ as a colorless oil. $[\alpha]^{25}{ }_{\mathrm{D}}=+39.8\left(\mathrm{c}=1.33, \mathrm{CHCl}_{3}\right)$; ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.22(4 \mathrm{H}, \mathrm{m}), 7.41(6 \mathrm{H}, \mathrm{m}), 4.66(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=6.8 \mathrm{~Hz}), 4.63$ $(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=6.8 \mathrm{~Hz}), 4.43(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=2.0 \mathrm{~Hz}), 4.17(1 \mathrm{H}, \mathrm{m}), 3.94(2 \mathrm{H}, \mathrm{m}), 3.71(1 \mathrm{H}, \mathrm{dd}, \mathrm{J}=$ $6.4,8.8 \mathrm{~Hz}), 3.60(1 \mathrm{H}, \mathrm{dd}, \mathrm{J}=2.8,8.8 \mathrm{~Hz}), 3.35(3 \mathrm{H}, \mathrm{s}), 3.14(1 \mathrm{H}, \mathrm{br}), 2.47(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=2.0$ $\mathrm{Hz}), 1.11(3 \mathrm{H}, \mathrm{s}), 1.07(12 \mathrm{H}, \mathrm{s}) ;{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 136.0, 135.9, 133.4, 133.3, $130.0,130.0,128.0,127.9,98.2,80.6,78.9,75.5,74.7,74.5,70.7,62.0,56.3,40.4,27.1$, 27.0, 23.8, 19.3, 15.4; IR $v \max$ (neat) $/ \mathrm{cm}^{-1} 3464,3293,3068,3040,1471,1428,1111$. $m / z$ (ESIMS) calculated for $\mathrm{C}_{28} \mathrm{H}_{38} \mathrm{O}_{5} \mathrm{SiNa}[\mathrm{MNa}]^{+} 505.24$, found: 505.4.

To a solution of compound $\mathbf{S 4 2 . 2}(48 \mathrm{mg}, 0.100 \mathrm{mmol})$ in 1.0 mL THF at $0{ }^{\circ} \mathrm{C}$ was added $\mathrm{NaH}(60 \%$ of suspension in mineral oil, $20 \mathrm{mg}, 0.500 \mathrm{mmol})$. After stirring for 5 min , MeI ( $284 \mathrm{mg}, 2.00 \mathrm{mmol}$ ) was added. The reaction flask was kept in an ice bath for 5 min and then the ice bath was removed. After stirring for another 1 h , the reaction was
quenched with $\mathrm{NH}_{4} \mathrm{Cl}$ solution and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organic extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure. The residue was purified by FCC (silica gel, ethyl acetate/hexane $1: 10$ ) to give 49 mg compound S42.3 (99\%) as a colorless oil. $[\alpha]^{25}{ }_{\mathrm{D}}=+16.2\left(\mathrm{c}=0.35, \mathrm{CHCl}_{3}\right) ;{ }^{1} \mathrm{H}$ NMR $(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 7.73(\mathrm{~m}, 4 \mathrm{H}), 7.40(\mathrm{~m}, 6 \mathrm{H}), 4.71(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=6.6 \mathrm{~Hz}) 4.61(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=6.6 \mathrm{~Hz})$, $4.51(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=1.5 \mathrm{~Hz}), 4.11(\mathrm{dd}, 1 \mathrm{H}, \mathrm{J}=4.8,10.5 \mathrm{~Hz}), 3.95(\mathrm{dd}, 2 \mathrm{H}, \mathrm{J}=3.9,4.5 \mathrm{~Hz})$, $3.85(\mathrm{dd}, 1 \mathrm{H}, \mathrm{J}=6.0,8.4 \mathrm{~Hz}), 3.50(\mathrm{~s}, 3 \mathrm{H}), 3.28(\mathrm{~m}, 4 \mathrm{H}), 2.43(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=2.1 \mathrm{~Hz}) 1.07(\mathrm{~s}$, 9H), $1.05(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 136.0, 135.9, 133.3, 133.2, 130.0, 129.9, $128.0,127.9,97.5,85.2,80.7,75.1,74.2,71.3,63.0,61.6,56.0,40.9,27.05,24.2,19.3$, 16.6; IR $v \max$ (neat) $/ \mathrm{cm}^{-1} 3289,3072,3048,1471,1428,1112 . \mathrm{m} / \mathrm{z}$ (ESIMS) calculated for $\mathrm{C}_{29} \mathrm{H}_{40} \mathrm{O}_{5} \mathrm{SiNa}[\mathrm{MNa}]^{+}$519.25, found: 519.4.

To a solution of $\mathrm{BH}_{3} / \mathrm{THF}(0.3 \mathrm{~mL}, 1.0 \mathrm{M})$ at $0^{\circ} \mathrm{C}$ was added 2-methyl-2-butene in THF ( $0.25 \mathrm{~mL}, 2.0 \mathrm{M}$ ). After stirring for 20 min , alkyne $\mathbf{S 4 2 . 3}$ ( $33 \mathrm{mg}, 0.066 \mathrm{mmol}$ ) in 1 mL THF was added. The reaction was kept at $0^{\circ} \mathrm{C}$ for 30 min and then 0.2 mL 3 M NaOH solution and $0.2 \mathrm{~mL} \mathrm{H} \mathrm{H}_{2} \mathrm{O}_{2}$ was added. After stirring for another 15 min at $0{ }^{\circ} \mathrm{C}$, the reaction mixture was diluted with distilled water and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organic extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure. The residue was purified by FCC (silica gel, ethyl acetate/hexane 1:8) to give 28 mg compound $\mathbf{S} 42.4(82 \%)$ as a colorless oil. $[\alpha]^{25}{ }_{\mathrm{D}}=+16.7\left(\mathrm{c}=0.30, \mathrm{CHCl}_{3}\right) ;{ }^{1} \mathrm{H}$

NMR (400 MHz, $\left.\mathrm{CDCl}_{3}\right) 9.78(\mathrm{dd}, 1 \mathrm{H}, \mathrm{J}=1.6,2.4 \mathrm{~Hz}), 7.73(\mathrm{~m}, 4 \mathrm{H}), 7.41(\mathrm{~m}, 6 \mathrm{H}) 4.66$ $(\mathrm{d}, 1 \mathrm{H}, \mathrm{J}=6.8 \mathrm{~Hz}), 4.53(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=6.8 \mathrm{~Hz}), 4.27(\mathrm{dd}, 1 \mathrm{H}, \mathrm{J}=2.8,10.4 \mathrm{~Hz}), 4.08(\mathrm{dd}, 1 \mathrm{H}$, $\mathrm{J}=6.4,11.2 \mathrm{~Hz}), 3.99(\mathrm{td}, 1 \mathrm{H}, \mathrm{J}=2.8,6.8 \mathrm{~Hz}), 3.84(\mathrm{~m}, 1 \mathrm{H}), 3.51(\mathrm{~s}, 3 \mathrm{H}), 3.29(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=$ $9.6 \mathrm{~Hz}), 3.17(\mathrm{~s}, 3 \mathrm{H}), 2.46(\mathrm{ddd}, 1 \mathrm{H}, \mathrm{J}=2.8,10.8,16.0 \mathrm{~Hz}) 2.35(\mathrm{~m}, 1 \mathrm{H}), 1.07(\mathrm{~s}, 9 \mathrm{H})$, $0.96(\mathrm{~s}, 3 \mathrm{H}), 0.89(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 202.4, 136.0, 135.9, 133.3, $133.2,130.0,129.9,128.0,127.9,97.2,85.5,80.7,75.6,73.9,62.4,62.0,55.8,43.5,31.8$, $27.0,23.5,19.3,14.7$; IR $v \max ($ neat $) / \mathrm{cm}^{-1} 3068,3043,1728,1471,1427,1112 ; \mathrm{m} / \mathrm{z}$ (ESIMS) calculated for $\mathrm{C}_{30} \mathrm{H}_{45} \mathrm{O}_{7} \mathrm{SiNa}[\mathrm{MNaMeOH}]^{+} 569.29$, found: 569.4.

To a solution of $\mathrm{Ph}_{3} \mathrm{PCH}_{3} \mathrm{Br}(54 \mathrm{mg}, 0.151 \mathrm{mmol})$ in 0.3 mL THF at $0{ }^{\circ} \mathrm{C}$ was added BuLi in THF ( $0.05 \mathrm{~mL}, 2.5 \mathrm{M}$ ) dropwise. After stirring for 30 min , aldehyde $\mathbf{S 4 2 . 4}$ ( 20 mg , 0.04 mmol ) in 0.3 mL THF was added. The reaction was allowed to warm to room temperature and stirred for 1.5 h , then it was quenched with NH 4 Cl solution and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organic extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure. To a solution of diol $\mathbf{S 4 2 . 1}$ ( $1.14 \mathrm{~g}, 2.6 \mathrm{mmol}$ ) in THF ( 20 mL , containing trace amount of water) at $0^{\circ} \mathrm{C}$ was added $\mathrm{NaH}(832 \mathrm{mg}, 10.4 \mathrm{mmol}, 60 \%$ dispersion in mineral oil) and the mixture was stirred for 10 min . To this was added a solution of TsCl in 6 mL THF and $200 \mu \mathrm{H} \mathrm{H}_{2} \mathrm{O}$. After stirring for 30 min , the mixture was quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$, extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. Solvent was removed and then the crude was purified by FCC using hexane/ethyl acetate (20:1) as eluent to furnish epoxide $\mathbf{S 4 3 . 1}$ $(760 \mathrm{mg}, 70 \%)$ as a colorless oil. $[\alpha]^{25}{ }_{\mathrm{D}}=-8.9\left(\mathrm{c}=1.23, \mathrm{CHCl}_{3}\right)$; IR $v_{\max }($ neat $) / \mathrm{cm}^{-1}$ 3285, 3071, 2960, 2930, 1471, 1427, 1113, 702; ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 7.71-7.68 $(4 \mathrm{H}, \mathrm{m}), 7.50-7.40(6 \mathrm{H}, \mathrm{m}), 4.26(1 \mathrm{H}, \mathrm{t}, \mathrm{J}=4.4 \mathrm{~Hz}), 4.20(1 \mathrm{H}, 2.4 \mathrm{~Hz}), 3.95-3.87(1 \mathrm{H}$, $\mathrm{m}), 3.38(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=4.0 \mathrm{~Hz}), 3.00(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=4.0 \mathrm{~Hz}), 2.51(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=2.4 \mathrm{~Hz}), 1.24(3 \mathrm{H}, \mathrm{s})$, $1.18(3 \mathrm{H}, \mathrm{s}), 1.09(9 \mathrm{H}, \mathrm{s}) ;{ }^{13} \mathrm{C}$ NMR (100 MHz) 135.6, 133.1, 129.9, 127.8, 80.1, 75.7, 70.7, 70.2, 64.9, 58.4, 53.1, 33.4, 26.8, 24.2, 21.6, 19.2; m/z (ESIMS) calculated for $\mathrm{C}_{26} \mathrm{H}_{32} \mathrm{O}_{3} \mathrm{Si} \mathrm{Na}[\mathrm{MNa}]^{+}$443.20, found: 443.3.

To a solution of epoxide $\mathbf{S 4 3 . 1}(0.61 \mathrm{mg}, 1.45 \mathrm{mmol})$ in $\mathrm{Et}_{2} \mathrm{O}(10 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ was added DIBAL ( $4.35 \mathrm{~mL}, 4.35 \mathrm{mmol}$ ) at one portion. After 10 min , the reaction mixture was quenched with saturated Rochelle's salt and diluted with $\mathrm{Et}_{2} \mathrm{O}$. The resulting biphasic solution was stirred for 1 h . The layers were separated, and then the aqueous layer was extracted with $\mathrm{Et}_{2} \mathrm{O}$ and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. Solvent was concentrated in vacuo and the crude was purified by FCC using hexane/ethyl acetate (10:1) as eluent to afford alcohol S43.2 (489 mg, 80\%) as a colorless oil. $[\alpha]^{25}=+2.44\left(\mathrm{c}=0.41, \mathrm{CHCl}_{3}\right)$; IR $v_{\max }($ neat $) / \mathrm{cm}^{-1} 3454,3285,3070,2957,2930,1472,1427,1112,702 ;{ }^{1} \mathrm{H}$ NMR (400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.69-7.67(4 \mathrm{H}, \mathrm{m}), 7.41-7.38(6 \mathrm{H}, \mathrm{m}), 4.40-4.20(2 \mathrm{H}, \mathrm{m}), 3.75(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=$ $4.8 \mathrm{~Hz}), 2.60-2.59(1 \mathrm{H}, \mathrm{m}), 2.38(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.4 \mathrm{~Hz}), 2.04-1.97(1 \mathrm{H}, \mathrm{m}), 1.71-1.66(1 \mathrm{H}$, $\mathrm{m}) ; m / z$ (ESIMS) calculated for $\mathrm{C}_{26} \mathrm{H}_{34} \mathrm{O}_{3} \mathrm{SiNa}[\mathrm{MNa}]^{+} 445.22$, found: 445.3.

To a solution of alcohol $\mathbf{S 4 3 . 2}$ ( $360 \mathrm{mg}, 0.85 \mathrm{mmol}$ ) in DMF $(10 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ was added Hunig's base ( $1.5 \mathrm{~mL}, 8.53 \mathrm{mmol})$ followed by $\mathrm{MOMCl}(0.65 \mathrm{~mL}, 8.53 \mathrm{mmol})$. The reaction mixture was stirred for 24 h at room temperature, and then quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution. The resulting mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The organic layers were washed with $\mathrm{H}_{2} \mathrm{O}$, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced
pressure under reduced pressure in vacuo. The crude was purified by FCC using ethyl acetate/hexane (1:20) to give product $\mathbf{S 4 3 . 3}$ as a colorless oil $(390 \mathrm{mg}, 97 \%) .[\alpha]^{25}{ }_{\mathrm{D}}=$ $+0.91\left(\mathrm{c}=1.10, \mathrm{CHCl}_{3}\right)$; IR $v_{\max }($ neat $) / \mathrm{cm}^{-1} 3288,3071,2949,2930,1472,1428,1042$, 702; ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 7.70-7.67 (4H, m), 7.41-7.39 (6H, m), $4.70(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=$ $6.8 \mathrm{~Hz}), 4.60(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=7.2 \mathrm{~Hz}), 4.22-4.18(2 \mathrm{H}, \mathrm{m}), 3.74(2 \mathrm{H}, \mathrm{J}=9.2 \mathrm{~Hz}), 3.55-3.52(1 \mathrm{H}$, m), $3.38(3 \mathrm{H}, \mathrm{s}), 1.94-1.89(2 \mathrm{H}, \mathrm{m}), 1.10(3 \mathrm{H}, \mathrm{s}), 1.07(9 \mathrm{H}, \mathrm{s}), 1.06(3 \mathrm{H}, \mathrm{s}) ;{ }^{13} \mathrm{C}$ NMR $(100 \mathrm{MHz}) 135.7,133.4,129.7,127.7,95.9,81.3,77.8,74.0,71.7,70.4,65.9,55.5,37.9$, 28.3, 26.8, 24.7, 19.2, 18.8; m/z (ESIMS) calculated for $\mathrm{C}_{28} \mathrm{H}_{38} \mathrm{O}_{4} \mathrm{SiNa}[\mathrm{MNa}]^{+} 489.24$, found: 489.3.

To the 2-methyl-2-butene ( 2.30 mL of 2 M solution in THF, 4.60 mmol ) cooled to $0{ }^{\circ} \mathrm{C}$ was added $\mathrm{BH}_{3} \cdot \mathrm{SMe}_{2}(1.15 \mathrm{~mL}$ of 1 M solution in THF, 2.30 mmol$)$ dropwise. The icebath was removed and the mixture was stirred for 1 h . The reaction mixture was cooled to $0^{\circ} \mathrm{C}$, to which was added a solution of alkyne $\mathbf{S 4 3 . 3}(356 \mathrm{mg}, 0.76 \mathrm{mmol})$ in THF slowly. The mixture was stirred for 30 min at room temperature and cooled back to $0{ }^{\circ} \mathrm{C}$. The reaction mixture was quenched with a precooled solution of 4 mL of 3 N NaOH and 1.4 mL of $30 \% \mathrm{H}_{2} \mathrm{O}_{2}$ dropwise. The resulting mixture was stirred for 30 min at room temperature, then and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The organic layers were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure under reduced pressure in vacuo. The crude was purified by FCC using hexane/ethyl acetate (15:1) to furnish aldehyde S43.4 (282 mg,
$76 \%)$ as a colorless oil. $[\alpha]^{25}{ }_{\mathrm{D}}=+7.14\left(\mathrm{c}=0.84, \mathrm{CHCl}_{3}\right)$; IR $v_{\max }($ neat $) / \mathrm{cm}^{-1} 3071,2949$, 2931, 2888, 2857, 1728, 1472, 1428, 1112, 702; ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $9.72(1 \mathrm{H}$, $\mathrm{dd}, \mathrm{J}=1.6,3.6 \mathrm{~Hz}), 4.68(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=5.2 \mathrm{~Hz}), 4.59(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=5.2 \mathrm{~Hz}), 4.04-3.96(2 \mathrm{H}, \mathrm{m})$, 3.78-3.67 $(2 \mathrm{H}, \mathrm{m}), 2.85-2.77(1 \mathrm{H}, \mathrm{m}), 2.44(1 \mathrm{H}, \mathrm{qd}, \mathrm{J}=1,17.6 \mathrm{~Hz}), 1.94-1.88(1 \mathrm{H}, \mathrm{m})$, 1.81-1.74 (1H, m); ${ }^{13} \mathrm{C}$ NMR (100 MHz) 202.5, 135.6, 133.3, 129.7, 127.7, 95.9, 78.2, $75.0,70.0,65.5,55.6,43.4,37.4,28.2,26.8,24.4,19.1,17.0 ; m / z$ (ESIMS) calculated for $\mathrm{C}_{28} \mathrm{H}_{40} \mathrm{O}_{5} \mathrm{SiNa}[\mathrm{MNa}]^{+}$507.25, found: 507.3.

To a solution of aldehyde $\mathbf{S} 46.1(1.65 \mathrm{~g}, 9.96 \mathrm{mmol})$ in DMF $(12 \mathrm{ml})$ at $0^{\circ} \mathrm{C}$ was added Hunig's base ( $5.2 \mathrm{ml}, 29.9 \mathrm{mmol}$ ) and $\mathrm{MOMCl}(2.27 \mathrm{ml}, 29.9 \mathrm{mmol})$. After stirring for 20 h at room temperature, the reaction mixture was quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ and then extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated in vacuo. The crude was passed through a pad of silica gel and used for next step without further purification.

A solution of aldehyde ( $2.4 \mathrm{mg}, 9.4 \mathrm{mmol}$ ) in $120 \mathrm{ml} \mathrm{tBuOH}-\mathrm{H}_{2} \mathrm{O}(1: 1)$ was cooled to 0 ${ }^{\circ} \mathrm{C}$, to which was added $\mathrm{NaH}_{2} \mathrm{PO}_{4} \cdot \mathrm{H}_{2} \mathrm{O}(3.38 \mathrm{~g}, 28.2 \mathrm{mmol})$, 2-methyl-2-butene ( 12.1 ml
from 2 M solution in THF, 28.2 mmol ) and $\mathrm{NaClO}_{2}(3.18 \mathrm{~g}, 28.2 \mathrm{mmol})$. After stirring for 4 h , the mixture was concentrated down, extracted with EtOAc and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The crude was passed through a pad of silica gel and used for next step without further purification.

A solution of acid $(2.48 \mathrm{~g}, 9.2 \mathrm{mmol})$ in THF $(25 \mathrm{ml})$ was treated with $\mathrm{PPh}_{3}(4.82 \mathrm{~g}, 18.4$ $\mathrm{mmol})$ and $\mathrm{MeOH}(1.8 \mathrm{ml}, 46 \mathrm{mmol})$ which was then cooled to $0^{\circ} \mathrm{C}$. DIAD $(3.72 \mathrm{~g}, 18.4$ mmol ) was added to reaction mixture. After stirring for 12 h , the mixture was diluted with $\mathrm{H}_{2} \mathrm{O}$ and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The organic extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated down under reduced pressure. The crude was purified by FCC using hexane:ethyl acetate (10:1) as eluent to furnish ester $\mathbf{S} 46.2$ ( $2.43 \mathrm{~g}, 86 \%$ over 3 steps) as yellowish oil. IR $v_{\max }$ (neat)/ $\mathrm{cm}^{-1} 2952,2913,2827,1731,1597,1481,1436,1271,1153$, 923; ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $6.77(1 \mathrm{H}, \mathrm{s}), 5.17(2 \mathrm{H}, \mathrm{s}), 5.13(2 \mathrm{H}, \mathrm{s}), 3.89(3 \mathrm{H}, \mathrm{s})$, $3.46(6 \mathrm{H}, \mathrm{s}), 2.18(3 \mathrm{H}, \mathrm{s}), 2.11(3 \mathrm{H}, \mathrm{s}) ;{ }^{13} \mathrm{C}$ NMR (100 MHz) 169.4, 156.5, 152.6, 135.6, $120.1,119.5,100.2,95.3,94.9,56.4,56.3,52.3,17.2,11.6 ; \mathrm{m} / \mathrm{z}$ (ESIMS) calculated for $\mathrm{C}_{14} \mathrm{H}_{20} \mathrm{O}_{6} \mathrm{Na}[\mathrm{MNa}]^{+} 307.2$, found: 307.2.

## CHAPTER 4

S64.3
To a solution of hexanamide $(75 \mathrm{mg}, 0.65 \mathrm{mmol})$ in $3 \mathrm{~mL} \mathrm{Et}_{2} \mathrm{O}$ was added $\mathrm{NEt}_{3}(101 \mathrm{mg}$, $1.0 \mathrm{mmol})$ and the mixture was cooled to $0{ }^{\circ} \mathrm{C}$. To this was added $\mathrm{Cy}_{2} \mathrm{BCl}$ in hexane $(0.75$ $\mathrm{mmol}, 1.0 \mathrm{M}$ ) in one portion. After stirring at this temperature for 30 min , aldehyde ( 56 $\mathrm{mg}, 0.5 \mathrm{mmol}$ ) was added dropwise to the reaction mixture. The mixture was stirred for 30 min and quenched with MeOH , phosphate buffer ( $\mathrm{pH}=7.4$ ) and $30 \% \mathrm{H}_{2} \mathrm{O}_{2}$. The resulting mixture was stirred for 30 min and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organic extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure. The residue was purified by FCC (silica gel, ethyl acetate/hexane 1:3) to give S64.3 (100.6 $\mathrm{mg}, 88 \%$ ) as white solid. IR $v \max (\mathrm{neat}) / \mathrm{cm}^{-1} 3246,3068,1645,1553,1026 ;{ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 6.28(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=7.8 \mathrm{~Hz}), 5.06(\mathrm{dd}, 1 \mathrm{H}, \mathrm{J}=7.8,7.5 \mathrm{~Hz}), 4.27(\mathrm{br}, 1 \mathrm{H})$ $2.16(\mathrm{t}, 1 \mathrm{H}, \mathrm{J}=7.5 \mathrm{~Hz}), 0.98-1.89(\mathrm{~m}, 17 \mathrm{H}), 0.87(\mathrm{t}, 3 \mathrm{H}, \mathrm{J}=6.6 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR ( 75 MHz , $\left.\mathrm{CDCl}_{3}\right) 174.5,77.7,42.5,37.1,31.8,28.5,28.4,26.6,26.1,26.0,25.6,22.7,14.3 ; \mathrm{m} / \mathrm{z}$ (ESIMS) calculated for $\mathrm{C}_{13} \mathrm{H}_{25} \mathrm{NO}_{2} \mathrm{Na}[\mathrm{MNa}]^{+} 250.18$, found: 250.2.

S65.2
A solution of benzamide $(73 \mathrm{mg}, 0.6 \mathrm{mmol})$ was treated with $\mathrm{NEt}_{3}(0.140 \mathrm{ml}, 1.0 \mathrm{mmol})$ and cooled to $0{ }^{\circ} \mathrm{C}$. To this was added $\mathrm{Cy}_{2} \mathrm{BCl}(0.65 \mathrm{mmol}, 1 \mathrm{M}$ in Hexane $)$, and then the
mixture was stirred for 30 min at room temperature. Then aldehyde $(0.074 \mathrm{ml}, 0.5 \mathrm{mmol})$ was added to reaction mixture. After the mixture was stirred for 30 min , the regular workup was applied. The crude product was purified by FCC (silica gel, hexane/ethyl acetate 2/1) to yield $90 \mathrm{mg}(71 \%)$ of $\mathbf{S 6 5 . 2}$ as a white solid. S66.2
A solution of $\alpha$-hydroxycarboxylic acid ( $275 \mathrm{mg}, 1.58 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{ml})$ was cooled to $0{ }^{\circ} \mathrm{C}$ and treated with $\mathrm{BzCl}(0.37 \mathrm{ml}, 3.16 \mathrm{mmol})$ and pyridine $(0.32 \mathrm{ml}, 3.95$ mmol). After stirring for 1 h , the reaction was quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution
and acidified with 3 N HCl until pH 2-3. The mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After removing the solvent in vacuo, the residue was purified by FCC ( $50 \%$ hexane:ethyl acetate and $1 \% \mathrm{AcOH}$ ) to furnish $350 \mathrm{mg}(80 \%)$ a benzoyl protected carboxylic acid as a colorless oil.

To a solution of benzoyl protected carboxylic acid ( $290 \mathrm{mg}, 1.04 \mathrm{mmol}$ ) in toluene (10 $\mathrm{ml})$ was added oxallyl chloride $(0.272 \mathrm{ml}, 3.12 \mathrm{mmol})$ and catalytic amount DMF. After stirring for 20 min at room temperature, the mixture was cooled to $-78^{\circ} \mathrm{C}$ and exposed to $\mathrm{NH}_{3}$ gas for 2 min . Stirring continued for 10 min and then the reaction was quenched with 3 N HCl until $\mathrm{pH} 2-3$. The mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \times)$, and the combined organic extract was washed with brine and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After removing the solvent in vacuo, the residue was purified by FCC using hexane:ethyl aceate (3:1) as eluate to furnish 220 mg ( $80 \%$ ) S 66.2 as a colorless oil. IR $v \max$ (neat)/ $\mathrm{cm}^{-1} 3448,3334$, 3182, 3074, 2978, 2936, 1727, 1692, 1600, 1451, 1267, 1111; ${ }^{1} \mathrm{H}$ NMR ( 500 MHz , $\left.\mathrm{CDCl}_{3}\right)$ 8.09-8.07 $(2 \mathrm{H}, \mathrm{m}), 7.63-7.60(1 \mathrm{H}, \mathrm{m}), 7.50-7.47(2 \mathrm{H}, \mathrm{m}), 6.22(1 \mathrm{H}, \mathrm{brs}), 5.98$ $(1 \mathrm{H}, \mathrm{brs}), 5.74(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=3.5), 4.86(1 \mathrm{H}, \mathrm{s}), 4.83(1 \mathrm{H}, \mathrm{s}), 3.46(3 \mathrm{H}, \mathrm{s}), 2.47-2.36(2 \mathrm{H}, \mathrm{m})$, $1.80(3 \mathrm{H}, \mathrm{s}) ;{ }^{13} \mathrm{C}$ NMR (125 MHz, $\mathrm{CDCl}_{3}$ ) 170.7, 165.2, 141.9, 133.9, 130.0, 129.3, $128.9,113.9,79.9,73.4,58.3,38.6,22.8 ; m / z(E S I M S)$ calculated for $\mathrm{C}_{14} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{Na}$ [MNa] ${ }^{+}$309.18, found: 309.1. $\mathrm{m} / \mathrm{z}$ (ESIMS) calculated for $\mathrm{C}_{15} \mathrm{H}_{19} \mathrm{NO}_{4} \mathrm{Na}[\mathrm{MNa}]^{+}$300.12, found: 299.4.

S66.3
To a solution of $\alpha$-hydroxylamide ( $60 \mathrm{mg}, 0.34 \mathrm{mmol}$ ) in DMF ( 4 ml ) was added TBSCl
$(102.6 \mathrm{mg}, 0.68 \mathrm{mmol})$ and DMAP $(83 \mathrm{mg}, 0.68 \mathrm{mg})$. After stirring for 1 h , the reaction was quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. After removing the solvent in vacuo, the residue was purified by FCC using hexane:ethyl aceate (1:1) as eluate to furnish $94 \mathrm{mg}(96 \%) \mathbf{S 6 6 . 2}$ as a colorless oil. IR $v \max$ (neat)/ $\mathrm{cm}^{-1} 3467,3264$, 3141, 2953, 2932, 1694, 1657, 1252, 1109; ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 6.53 ( $1 \mathrm{H}, \mathrm{brs}$ ), $6.11(1 \mathrm{H}, \mathrm{brs}), 4.69(1 \mathrm{H}, \mathrm{s}), 4.65(1 \mathrm{H}, \mathrm{s}), 3.57-3.56(1 \mathrm{H}, \mathrm{m}), 3.29(3 \mathrm{H}, \mathrm{s}), 2.23-2.17(1 \mathrm{H}$, m), 2.01-1.96(1H, m), $1.64(3 \mathrm{H}, \mathrm{s}), 0.83(9 \mathrm{H}, \mathrm{s}), 0.04(3 \mathrm{H}, \mathrm{s}), 0.00(3 \mathrm{H}, \mathrm{s}) ;{ }^{13} \mathrm{C}$ NMR $\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 175.3,142.6,112.7,81.9,74.1,58.0,37.6,26.0,22.8,18.3,-4.3,-5.3$; $m / z$ (ESIMS) calculated for $\mathrm{C}_{14} \mathrm{H}_{29} \mathrm{NO}_{3} \mathrm{NaSi}[\mathrm{MNa}]^{+} 310.18$, found: 310.2 .

To a solution of alcohol $(110 \mathrm{mg}, 0.26 \mathrm{mmol})$ in pyridine $(5 \mathrm{ml})$ was added $\mathrm{Ac}_{2} \mathrm{O}(0.5 \mathrm{ml}$, 5.2 mmol ) at rt . After 12 h , the mixture was quenched with saturated $\mathrm{NaHCO}_{3}$ and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organic extracts were washed with 1 N HCl solution and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The crude was passed through a pad of silica gel and used for next step without further purification.

A solution of acetate protected alcohol ( $118 \mathrm{mg}, 0.25 \mathrm{mmol}$ ) in THF ( 3 ml ) was treated with TBAF ( $1.00 \mathrm{mmol}, 1.0 \mathrm{M}$ in THF) at rt . The reaction mixture was quenched with $\mathrm{H}_{2} \mathrm{O}$ after 3 h , and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The organic extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated down under reduced pressure. The residue was purified by FCC (silica gel, ethyl acetate/hexane 1:3) to give $\mathbf{S 6 7 . 2}$ ( $53 \mathrm{mg}, 90 \%$, over 2 steps) as colorless oil.

To a solution of oxallyl chloride ( $33 \mathrm{ml}, 0.37 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1 \mathrm{ml})$ at $-78{ }^{\circ} \mathrm{C}$ was added DMSO ( $53.0 \mathrm{ml}, 0.75 \mathrm{mmol}$ ) slowly. After stirring for 15 min at that temperature, a solution of alcohol ( $56.0 \mathrm{mg}, 0.25 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was injected to the mixture. After 20 $\mathrm{min}, \mathrm{NEt}_{3}(173 \mathrm{ml}, 1.25 \mathrm{mmol})$ was added to reaction mixture. Stirring continued at -78 ${ }^{\circ} \mathrm{C}$ for 5 min , and then ice-bath was removed. After stirring at rt for 20 min , the mixture was quenched with sat $\mathrm{NH}_{4} \mathrm{Cl}$. The resulting mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The residue was purified by FCC (silica gel, ethyl acetate/hexane $1: 3$ ) to give S67.2 (40 mg, 70\%) as colorless oil. IR $v \max$ (neat) $/ \mathrm{cm}^{-1} 3283,2925,2854$, 2103, 1736, 1456, 1243.6; ${ }^{1} \mathrm{H}$ NMR (500 MHz, $\left.\mathrm{CDCl}_{3}\right) 9.74(1 \mathrm{H}, \mathrm{s}), 4.76(1 \mathrm{H}, \mathrm{dd}, \mathrm{J}=6.5$, $3.5 \mathrm{~Hz}), 4.53(1 \mathrm{H}, \mathrm{dd}, \mathrm{J}=8.5,4.5 \mathrm{~Hz}), 4.28(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=2.5 \mathrm{~Hz}), 4.28(3 \mathrm{H}, \mathrm{s}), 2.55(1 \mathrm{H}, \mathrm{d}$, $\mathrm{J}=2.5 \mathrm{~Hz}), 2.09(3 \mathrm{H}, \mathrm{s}), 2.08-2.05(1 \mathrm{H}, \mathrm{m}), 1.94-1.90(1 \mathrm{H}, \mathrm{m}), 1.08(6 \mathrm{H}, \mathrm{s}) ;{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 201.5, 170.3, 79.6, 75.8, 74.8, 72.8, 72.8, 37.4, 26.5, 24.3, 21.1, 19.2; $m / z$ (ESIMS) calculated for $\mathrm{C}_{12} \mathrm{H}_{16} \mathrm{O}_{4} \mathrm{Na}[\mathrm{MNa}]^{+}$247.2, found: 247.1.

A solution of $\mathbf{S 6 7 . 1}$ ( $70 \mathrm{mg}, 0.17 \mathrm{mmol}$ ) in EtOAc ( 2 ml ) was treated with catalytic amount of $\mathrm{Pd}-\mathrm{C}$ and then stirred for 10 min under hydrogen gas. The mixture was filtered through celite. The crude was passed through a pad of silica gel and used for next step without further purification.

A solution of TBDPS protected pyran ring in THF ( 3 ml ) was treated with TBAF and stirred for 3 h . The reaction was diluted with water and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The
extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After removal of solvent, the residue was purified by FCC (silica gel, ethyl acetate/hexane 1:4) to give 35 mg compound ( $88 \%$, over 2 steps) as colorless oil.

To a solution of oxallyl chloride $(0.021 \mathrm{ml}, 0.23 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1 \mathrm{ml})$ at $-78{ }^{\circ} \mathrm{C}$ was added DMSO ( $0.033 \mathrm{ml}, 0.47 \mathrm{mmol}$ ) slowly. After stirring for 15 min at that temperature, a solution of alcohol ( $35.0 \mathrm{mg}, 0.15 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was injected to the mixture. After $20 \mathrm{~min}, \mathrm{NEt}_{3}(0.173 \mathrm{ml}, 1.25 \mathrm{mmol})$ was added to reaction mixture. Stirring continued at $-78{ }^{\circ} \mathrm{C}$ for 5 min , and then ice-bath was removed. After stirring at rt for 20 min , the mixture was quenched with sat $\mathrm{NH}_{4} \mathrm{Cl}$. The resulting mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The residue was purified by FCC (silica gel, ethyl acetate/hexane 1:3) to give $\mathbf{S 6 7 . 4}$ ( $23.5 \mathrm{mg}, 68 \%$ ) as colorless oil. S68.1
To a solution of amide ( $100.0 \mathrm{mg}, 0.35 \mathrm{mmol})$, in 3 ml of $\mathrm{Et}_{2} \mathrm{O}$ was added $\mathrm{NEt}_{3}(100 \mathrm{ml}$, 0.70 mmol ) and the mixture was cooled to $0{ }^{\circ} \mathrm{C}$. To this was added $\mathrm{Cy}_{2} \mathrm{BCl}$ in hexane $(0.52 \mathrm{mmol}, 1.0 \mathrm{M})$ in one portion. After stirring at $0{ }^{\circ} \mathrm{C}$ for 30 min , aldehyde $(32.5 \mathrm{mg}$, 0.29 mmol ) was added to the reaction mixture. The mixture was stirred for 30 min and
quenched with MeOH , phosphate buffer $(\mathrm{pH}=7.4)$ and $30 \% \mathrm{H}_{2} \mathrm{O}_{2}$. The resulting mixture was stirred for 30 min and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organic extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure. The residue was purified by FCC (silica gel, ethyl acetate/hexane 1:3) to give product (74 mg, $66 \%$, dr=1:1 determined by HNMR).

Isomer A; IR $v \max ($ neat $) / \mathrm{cm}^{-1} 3433,3358,3073,2927,2853,1728,1671,1520,1451$, 1263, 1111, $711 ;{ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $8.08(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=7.5 \mathrm{~Hz}), 7.63(1 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.5$ $\mathrm{Hz}), 7.50(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.5 \mathrm{~Hz}), 6.76(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=7.5 \mathrm{~Hz}), 5.66(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=4.0 \mathrm{~Hz}), 5.12(1 \mathrm{H}, \mathrm{t}$, $\mathrm{J}=7.5 \mathrm{~Hz}), 4.86(1 \mathrm{H}, \mathrm{s}), 4.83(1 \mathrm{H}, \mathrm{s}), 3.97-3.94(1 \mathrm{H}, \mathrm{m}), 3.46(3 \mathrm{H}, \mathrm{s}), 3.45(1 \mathrm{H}, \mathrm{bs}), 2.44-$ $2.38(2 \mathrm{H}, \mathrm{m}), 1.82-1.63(7 \mathrm{H}, \mathrm{m}), 1.25-0.96(7 \mathrm{H}, \mathrm{m}) ;{ }^{13} \mathrm{C}$ NMR (125 MHz, $\left.\mathrm{CDCl}_{3}\right)$ 169.4, $165.2,141.8,134.0,130.0,129.2,128.9,113.7,79.9,77.8,73.8,58.3,42.1,38.7,28.09$, 28.02, 26.4, 25.84, 25.78, 22.9; $m / z$ (ESIMS) calculated for $\mathrm{C}_{13} \mathrm{H}_{25} \mathrm{NO}_{2} \mathrm{Na}[\mathrm{MNa}]^{+} 412.1$, found: 412.1.

Isomer B; IR $v \max (\mathrm{neat}) / \mathrm{cm}^{-1} 3427,3369,3073,2928,2853,1727.6,1673,1527,1451$, $1265,1114,710 ;{ }^{1} \mathrm{H}$ NMR ( $\left.500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 8.07(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=7.5 \mathrm{~Hz}), 7.63(1 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.5$ $\mathrm{Hz}), 7.50(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.5 \mathrm{~Hz}), 6.79(1 \mathrm{H}, \mathrm{d}, 8 \mathrm{~Hz}), 5.66(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=4 \mathrm{~Hz}), 5.15(1 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.5$ $\mathrm{Hz}), 4.85(1 \mathrm{H}, \mathrm{s}), 4.82(1 \mathrm{H}, \mathrm{s}), 3.95-3.92(1 \mathrm{H}, \mathrm{m}), 3.46(3 \mathrm{H}, \mathrm{s}), 3.36(1 \mathrm{H}, \mathrm{bs}), 2.43-2.32$ $(2 \mathrm{H}, \mathrm{m}), 1.86-1.66(7 \mathrm{H}, \mathrm{m}), 1.28-1.04(7 \mathrm{H}, \mathrm{m}) ;{ }^{13} \mathrm{C}$ NMR (125 MHz, $\left.\mathrm{CDCl}_{3}\right)$ 169.2, $165.1,141.8,133.9,130.0,129.2,128.9,113.7,79.9,77.8,73.7,58.4,42.2,38.8,28.16$, 28.11, 26.4, 25.92, 25.82, 22.9; $m / z$ (ESIMS) calculated for $\mathrm{C}_{13} \mathrm{H}_{25} \mathrm{NO}_{2} \mathrm{Na}[\mathrm{MNa}]^{+} 412.1$, found: 412.1.

To a solution of $\mathbf{S 6 6 . 3}$ ( $17.5 \mathrm{mg}, 0.06 \mathrm{mmol}$ ) in 1 ml of $\mathrm{Et}_{2} \mathrm{O}$ was added $\mathrm{NEt}_{3}(14 \mathrm{ml}$, $0.10 \mathrm{mmol})$ the mixture was cooled to $0{ }^{\circ} \mathrm{C}$. To this was added $\mathrm{Cy}_{2} \mathrm{BCl}$ in hexane $(0.075$ $\mathrm{ml}, 1.0 \mathrm{M})$ in one portion. After stirring at $0{ }^{\circ} \mathrm{C}$ for 30 min , a solution of $\mathbf{S 6 7 . 2}(10 \mathrm{mg}$, 0.04 mmol ) in 0.4 ml of $\mathrm{Et}_{2} \mathrm{O}$ was added to the reaction mixture. The mixture was stirred for 30 min at room temperature and quenched with MeOH , phosphate buffer $(\mathrm{pH}=7.4)$ and $30 \% \mathrm{H}_{2} \mathrm{O}_{2}$. The resulting mixture was stirred for 30 min and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organic extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure. The residue was purified by FCC (silica gel, ethyl acetate/hexane 1:5) to give product ( $8 \mathrm{mg}, 40 \%$, dr, 1:1 by HNMR).

Isomer A; ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.60(1 \mathrm{H}$, brs $), 5.27-5.23(1 \mathrm{H}, \mathrm{m}), 4.90-4.89(1 \mathrm{H}$, $\mathrm{m}), 4.80(1 \mathrm{H}, \mathrm{s}), 4.77(1 \mathrm{H}, \mathrm{s}), 4.39(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=2.0 \mathrm{~Hz}), 4.24-4.20(2 \mathrm{H}, \mathrm{m}), 3.77(1 \mathrm{H}, \mathrm{d}$, $\mathrm{J}=4.5 \mathrm{~Hz}), 3.71-3.68(1 \mathrm{H}, \mathrm{m}), 3.41(3 \mathrm{H}, \mathrm{s}), 2.50(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=2.0 \mathrm{~Hz}), 2.32-2.28(2 \mathrm{H}, \mathrm{m})$, $2.09(3 \mathrm{H}, \mathrm{s}), 1.87-1.85(2 \mathrm{H}, \mathrm{m}), 1.75(3 \mathrm{H}, \mathrm{s}), 1.14(3 \mathrm{H}, \mathrm{s}), 1.04(3 \mathrm{H}, \mathrm{s}), 0.96(9 \mathrm{H}, \mathrm{s}), 0.16$ $(3 H, s), 0.11(3 H, s)$.

Isomer B; ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.81(1 \mathrm{H}, \mathrm{brs}), 5.28-5.25(1 \mathrm{H}, \mathrm{m}), 4.95-4.94(1 \mathrm{H}$, m), $4.79(1 \mathrm{H}, \mathrm{s}), 4.76(1 \mathrm{H}, \mathrm{s}), 4.40(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=2.0 \mathrm{~Hz}), 4.40(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=1.5 \mathrm{~Hz}), 4.33(1 \mathrm{H}, \mathrm{d}$, $\mathrm{J}=2.0 \mathrm{~Hz}), 4.15(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=11 \mathrm{~Hz}), 3.72-3.69(1 \mathrm{H}, \mathrm{m}), 3.41(3 \mathrm{H}, \mathrm{s}), 3.09(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=6.0$ $\mathrm{Hz}), 2.46(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=2.0 \mathrm{~Hz}), 2.33-2.28(1 \mathrm{H}, \mathrm{m}), 2.24-2.18(1 \mathrm{H}, \mathrm{m}), 2.09(3 \mathrm{H}, \mathrm{s}), 1.74$ $(3 \mathrm{H}, \mathrm{s}), 1.68(3 \mathrm{H}, \mathrm{s}), 1.04(3 \mathrm{H}, \mathrm{s}), 0.98(3 \mathrm{H}, \mathrm{s}), 0.16(3 \mathrm{H}, \mathrm{s}), 0.12(3 \mathrm{H}, \mathrm{s})$.

(S68.3)
To a solution of $\mathbf{S 6 6 . 2}$ ( $36.5 \mathrm{mg}, 0.13 \mathrm{mmol}$ ) in 1 ml of $\mathrm{Et}_{2} \mathrm{O}$ was added $\mathrm{NEt}_{3}(14 \mathrm{ml}$, $0.10 \mathrm{mmol})$ the mixture was cooled to $0{ }^{\circ} \mathrm{C}$. To this was added $\mathrm{Cy}_{2} \mathrm{BCl}$ in hexane $(0.075$ $\mathrm{ml}, 1.0 \mathrm{M})$ in one portion. After stirring at $0{ }^{\circ} \mathrm{C}$ for 30 min , a solution of $\mathbf{S 6 7 . 2}(20 \mathrm{mg}$, 0.09 mmol ) in 0.4 ml of $\mathrm{Et}_{2} \mathrm{O}$ was added to the reaction mixture. The mixture was stirred for 30 min at room temperature and quenched with MeOH , phosphate buffer $(\mathrm{pH}=7.4)$ and $30 \% \mathrm{H}_{2} \mathrm{O}_{2}$. The resulting mixture was stirred for 30 min and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organic extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure. The residue was purified by FCC (silica gel, ethyl acetate/hexane 1:5) to give a mixture of inseparable products ( $18 \mathrm{mg}, 40 \%$, dr; $1: 1$ by HNMR).

To a solution of $\mathbf{S 6 6 . 2}(11.0 \mathrm{mg}, 0.063 \mathrm{mmol})$ in 1 ml of $\mathrm{Et}_{2} \mathrm{O}$ was added $\mathrm{NEt}_{3}(14 \mathrm{ml}$, $0.10 \mathrm{mmol})$ the mixture was cooled to $0{ }^{\circ} \mathrm{C}$. To this was added $\mathrm{Cy}_{2} \mathrm{BCl}$ in hexane $(0.075$ $\mathrm{ml}, 1.0 \mathrm{M})$ in one portion. After stirring at $0{ }^{\circ} \mathrm{C}$ for 30 min , a solution of $\mathbf{S 6 7 . 4}(20 \mathrm{mg}$, 0.09 mmol ) in 0.4 ml of $\mathrm{Et}_{2} \mathrm{O}$ was added to the reaction mixture. The mixture was stirred for 30 min at room temperature and quenched with MeOH , phosphate buffer $(\mathrm{pH}=7.4)$ and $30 \% \mathrm{H}_{2} \mathrm{O}_{2}$. The resulting mixture was stirred for 30 min and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organic extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced
pressure. The residue was purified by FCC (silica gel, ethyl acetate/hexane 1:5) to give a mixture of inseparable products ( $9 \mathrm{mg}, 40 \%$, dr; 2:1 by HNMR).

## CHAPTER 5

## General procedure for thionoesters:

A solution of thiobenzoic acid in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(\sim 0.2 \mathrm{M})$ was treated with $\mathrm{NEt}_{3}$ and then cooled to $0^{\circ} \mathrm{C}$. This mixture was charged with TMSOTf and stirred for 10 min in ice bath. Then, $\mathrm{FeCl}_{3}$, a base (if necessary) and an azide was added. The mixture was stirred for indicated time at room temperature, quenched with saturated $\mathrm{NaHCO}_{3}$ and extracted with dichloromethane. The extractions were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporate under vacuum. The crude was purified by FCC using Hex to give the corresponding amide product.

Genereal procedure for thioacids:
A solution of thioacid in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(\sim 0.2 \mathrm{M})$ was exposed to $\mathrm{FeCl}_{3}$, a base (if necessary) and an azide and the mixture was stirred for indicated time at room temperature. The reaction quenched with saturated $\mathrm{NaHCO}_{3}$ and extracted with dichloromethane. The extractions were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporate under vacuum. The crude was purified by FCC to give the corresponding amide products.

## Characterization of Side Products:

S79.1: m.p. $=41-42{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR (400 MHz, DMSO) 7.82-7.79 (2H, m), 7.70-7.66 (1H, $\mathrm{m}), 7.56-7.52(2 \mathrm{H}, \mathrm{m}), 7.37-7.23(5 \mathrm{H}, \mathrm{m}), 5.27(1 \mathrm{H}, \mathrm{t}, \mathrm{J}=4.8 \mathrm{~Hz}), 4.11(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=4.8 \mathrm{~Hz})$.
${ }^{13} \mathrm{C}$ NMR (100 MHz, DMSO) 198.0, 139.8, 135.3, 134.4, 129.7, 128.7, 128.6, 127.6, 126.5, 55.1. IR $v_{\max }\left(\mathrm{KBr}\right.$ pellet, $\left.\mathrm{cm}^{-1}\right) 3304,3023,2923,2864,2804,1651,1442.5,1199$, 1042, 907. $\mathrm{m} / \mathrm{z}$ (ESIMS) calculated for $\mathrm{C}_{14} \mathrm{H}_{13} \mathrm{NOS}[\mathrm{MH}]^{+}$244.07, found: 244.1.]

S79.2: m.p. $=108-109{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR (400 MHz, DMSO) $9.20(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.4 \mathrm{~Hz}), 7.98(2 \mathrm{H}$, d, J=7.2 Hz), 7.67-7.24 (18H, m), 6.57-6.55 (1H, d, J=8.4 Hz), $4.46(2 H, d d, J=70,14$ $\mathrm{Hz}) .{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CHCl}_{3}$ ) 202.3, 166.9, 138.6, 137.6, 134.8, 134.3, 134.1, 131.9, 129.08, 129.04, 128.93, 128.91, 128.6, 128.5, 128.2, 127.7, 127.5, 127.2, 73.3, 60.0. IR $v_{\text {max }}\left(\mathrm{KBr}\right.$ pellet, $\left.\mathrm{cm}^{-1}\right) 3328,3056,3025,2917,2857,1658,1595,1575,1511,1479$, 1203, $900 . m / z(E S I M S)$ calculated for $\mathrm{C}_{28} \mathrm{H}_{24} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~S}[\mathrm{MNa}]^{+}$475.16, found: 475.2].

S79.3: m.p. $=158-160{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{DMSO}$ ) $9.68(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.2 \mathrm{~Hz}), 7.94-$ $7.89(4 \mathrm{H}, \mathrm{m}), 7.72-7.68(1 \mathrm{H}, \mathrm{m}), 7.58-7.32(10 \mathrm{H}, \mathrm{m}), 7.12(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.2 \mathrm{~Hz}) .{ }^{13} \mathrm{C}$ NMR (100 MHz, DMSO) 191.9, 166.3, 139.1, 136.7, 134.1, 132.2, 129.0, 128.9, 128.4, 127.70, $127.5,127.52,127.50,127.0,57.07$. IR $v_{\max }\left(\mathrm{KBr}\right.$ pellet, $\left.\mathrm{cm}^{-1}\right) 3283,3054,2920,1671$, 1626, 1509, 1480, 1201, 903. $\mathrm{m} / \mathrm{z}$ (ESIMS) calculated for $\mathrm{C}_{21} \mathrm{H}_{17} \mathrm{NO}_{2} \mathrm{~S}[\mathrm{MNa}]^{+}$370.1, found: 370.0].

All the azides in table 7 and Scheme 77 as well as the corresponding amides in table 7 are known compounds. The characterization data for the dimer $\mathbf{S 7 8 . 1}$ were also reported in literature.

## SEZGIN KIREN

## Education

## 2007 PhD in Chemistry

Rutgers, The State University of New Jersey, Piscataway, NJ
2005 Ms in Chemistry
Rutgers, The State University of New Jersey, Piscataway, NJ
1999 BS in Chemistry
Marmara University, Istanbul, Turkey

## Academic \& Teaching Activities

2002-2007 Teaching Assistant, for Organic Chemistry
Rutgers University, Piscataway, NJ

## Publications

## Journal Papers:

- Kiren, S.; Shangguan, N.; Williams, L. J. Direct Carbinolamide Synthesis. Tetrahedron Lett. 2007, 48, 7456-7459.
- Lotesta, S. D.; Kiren, S.; Sauers, R. R.; Williams, L. J. Spirodiepoxides: Heterocycle Synthesis and Mechanistic insight Angew. Chem. Int. Ed. 2007, 46, 7108-7111.
- Shangguan, N.; Kiren, S.; Williams, L. J. A Formal Synthesis of Psymberin. Org. Lett. 2007, 9, 1093-1096.
- Kiren, S.; Williams, L. J. Configuration of the Psymberin Side Chain. Org. Lett. 2005, 7, 2905-2908.
- Kiren, S.; Wang, Z.; Williams, L. J. Iron (III) Chloride and DMAP promoted Thioacid-azide coupling. (Manuscript in preparation).

## Books:

- Concise Organic Chemistry for the Students of Chemistry, Biology and Medicine with Study Guide, Salih Yaslak, Sezgin Kiren, 2001, Beta Basim Yayim Dagitim A. S. Istanbul/Turkey.
